US NAVAL RESEARCH LABORATORY  
The Navy and Marine Corps Corporate Laboratory

# NRL has a distinguished history

THOMAS A. EDISON

“GOVERNMENT SHOULD MAINTAIN A GREAT RESEARCH LABORATORY TO DEVELOP GUNS, NEW EXPLOSIVES AND ALL THE TECHNIQUE OF MILITARY AND NAVAL PROGRESSION WITHOUT ANY VAST EXPENSE.”

THOMAS A. EDISON,  
THE NEW YORK TIMES MAGAZINE  
SUNDAY, MAY 30, 1915

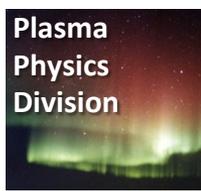

## A WORLD-CLASS LABORATORY

- Idea followed the sinking of the Lusitania in 1915
- Secretary Josephus Daniels Established Naval Consulting Board with Edison Chair, meeting October 7, 1915
- August 29, 1916 Congress appropriates funds to establish the Lab
- Delayed by WW-I, Assistant Secretary of the Navy, Theodore Roosevelt, Jr. Commissions the Lab at Bellevue site on July 2, 1923

*Primarily In-house Research to support Navy and Marine Corps needs*

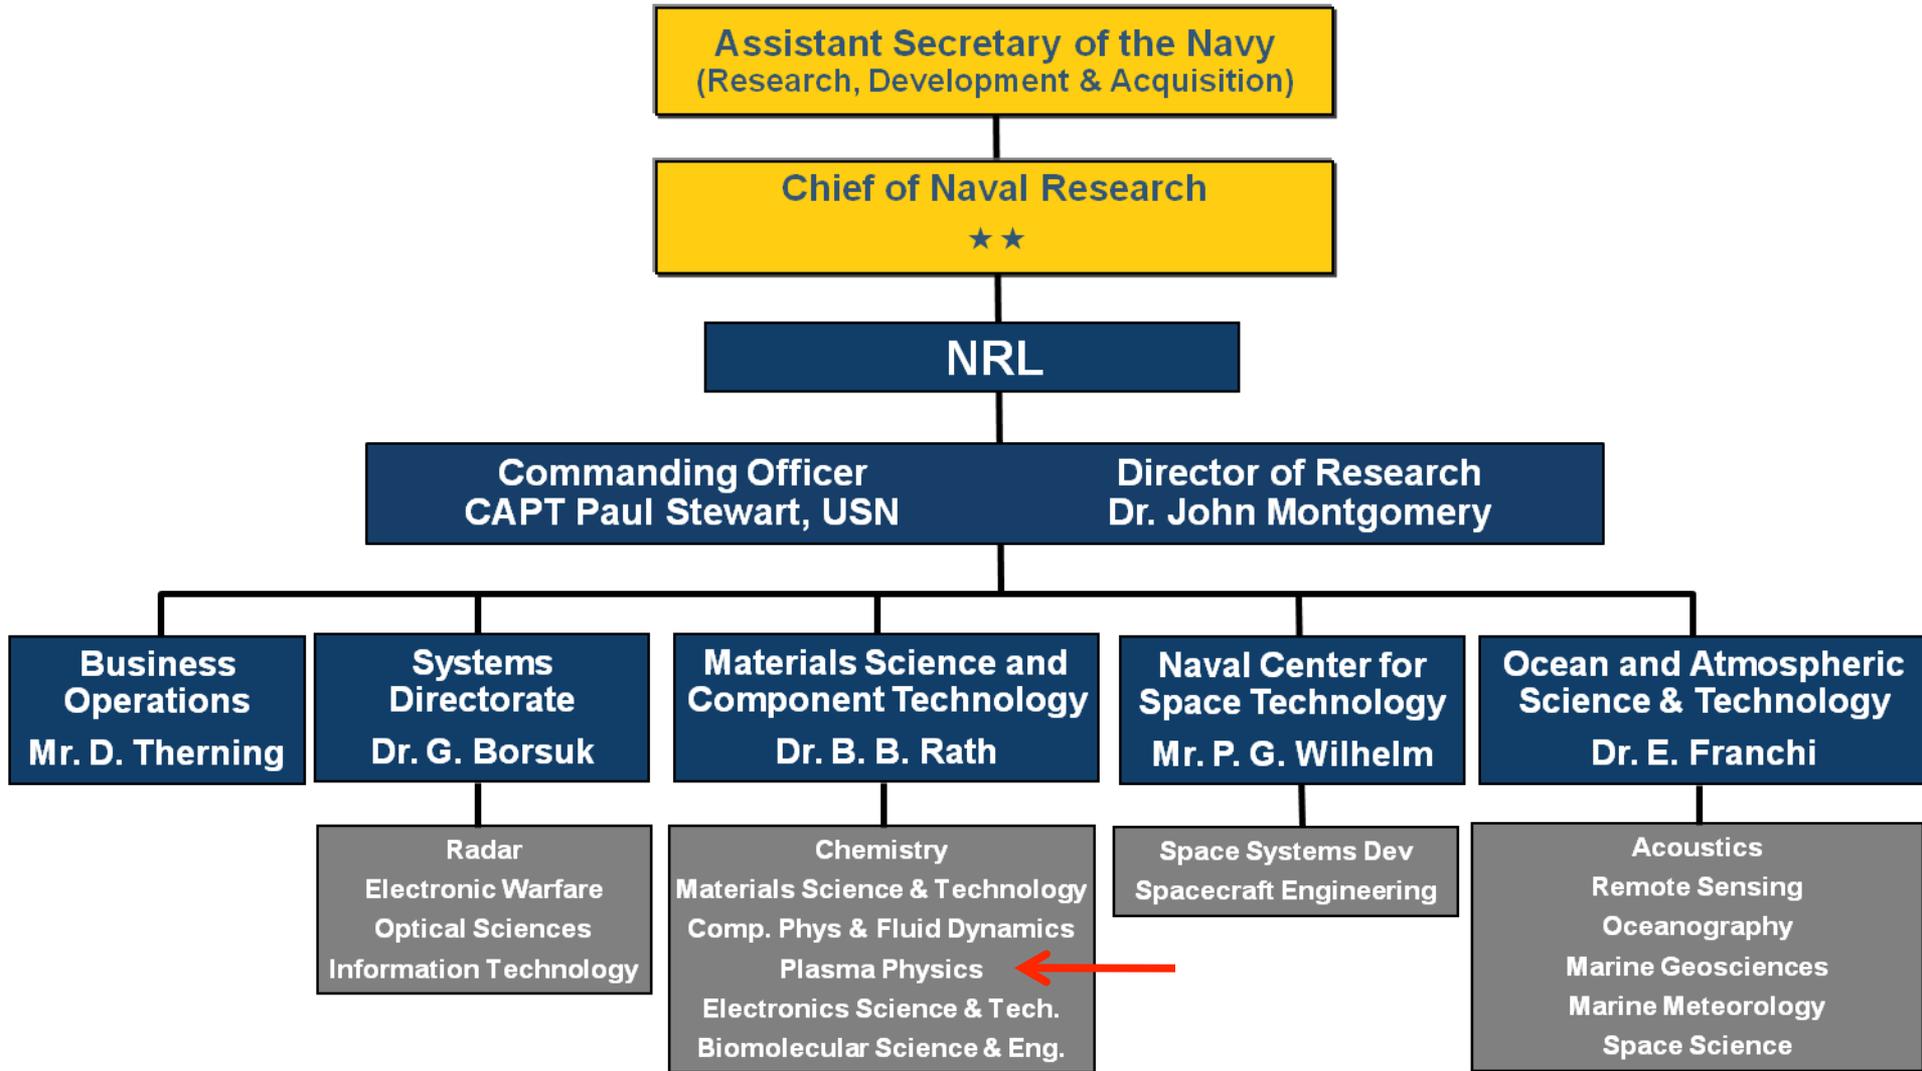

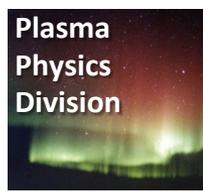

# NRL: Navy's designated corporate laboratory by SECNAV 1991

- MISSION is to conduct a **broadly based multidisciplinary program** of scientific research and advanced technological development directed toward maritime applications of new and improved materials; techniques; equipment; systems; ocean, atmospheric, and space sciences; and related technologies.
- Primary **in-house research** for the physical, engineering, space, and environmental sciences
- Broadly based applied research and advanced technology development program in **response to identified and anticipated Navy and Marine Corps needs** and support to the Naval Warfare Centers

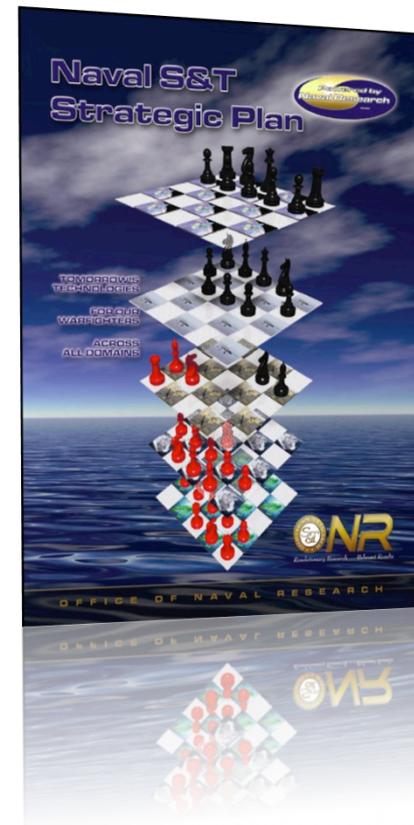

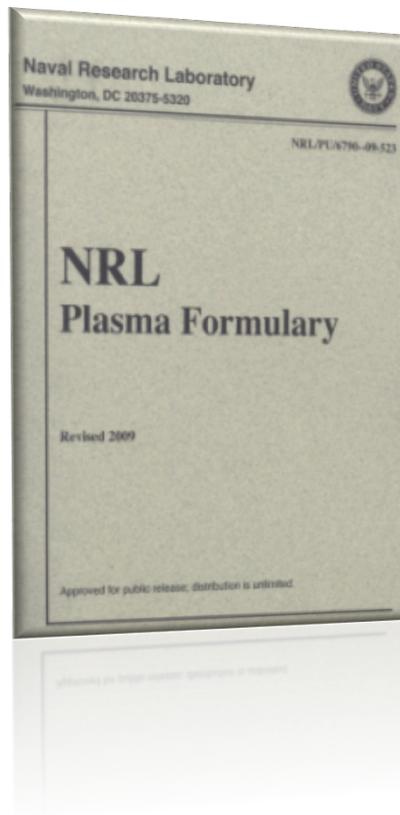

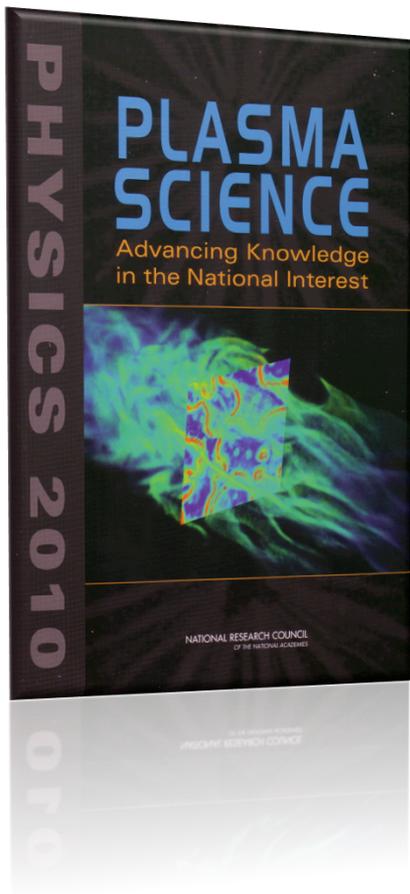

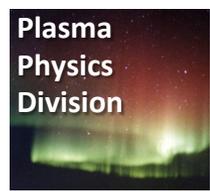

# Plasma Physics is one of 18 NRL Research Divisions

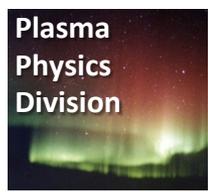

# NRL has world-wide recognition in plasma physics & related technologies

Plasma  
Physics  
Division

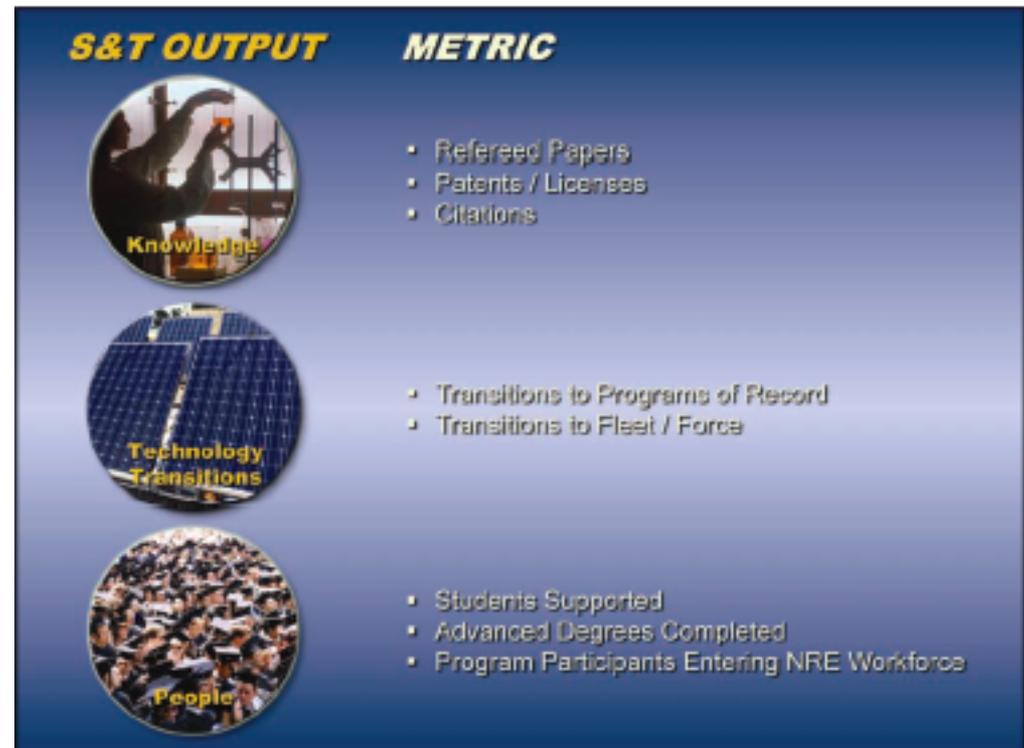

# Naval S&T Strategic Plan

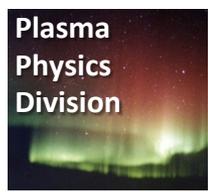

## Naval S&T Vision: Sponsor scientific research and technology to:

- Pursue revolutionary, game-changing capabilities for Naval forces of the future,
- Mature and transition S&T advances to improve existing Naval capabilities,
- Respond quickly to current Fleet and Force critical needs, and
- Maintain broad technology investments to hedge against uncertainty and to anticipate and counter potential technology surprise.

# The 2010 NRC decadal assessment of Plasma Science identifies opportunities & challenges

Plasma  
Physics  
Division

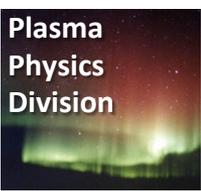

**Principal Conclusion:** The expanding scope of plasma research is creating an abundance of new scientific opportunities and challenges. These opportunities promise to further expand the role of plasma science in enhancing economic security and prosperity, energy and environmental security, national security, and scientific knowledge.

## Major Topics

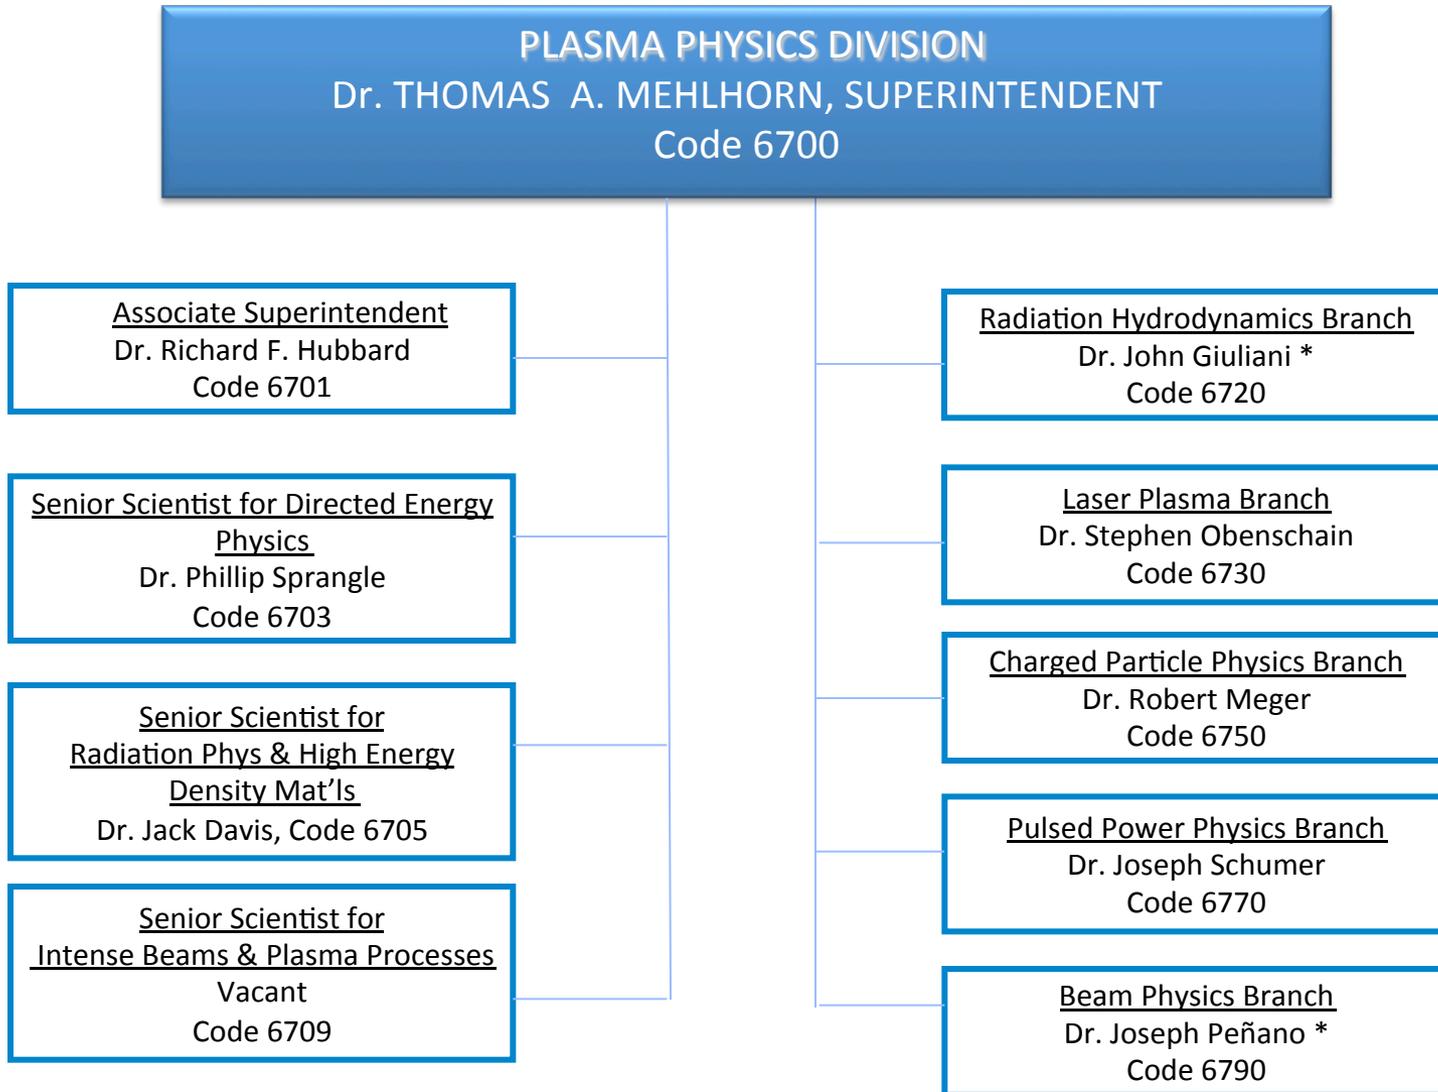

- Low-Temperature Plasma Science & Engineering
- Plasma Physics at High Energy Density
- The Plasma Science of Magnetic Fusion
- Space & Astrophysical Plasmas
- Basic Plasma Science

“The past decade has seen an acceleration of foreign research, investment, and discoveries in plasma physics. Increasing foreign participation testifies to the compelling scientific opportunities.”

# Power Projection and Integrated Defense

**Vision:** Enhance extended-range power projection capabilities and integrated layered defense by improving manned and unmanned Naval platforms, enabling forces to complete missions in hostile environments by avoiding, defeating and surviving attacks. Demonstrate improvements in standoff indirect precision fires on time-critical targets, while limiting collateral effects through the use of **electromagnetic kinetic projectiles**, hypersonic missile propulsion, **scalable weapons effects**, **directed energy** and **hypervelocity weapons**.

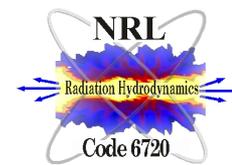

# Directed ion/neutron beams using ultrashort pulse lasers

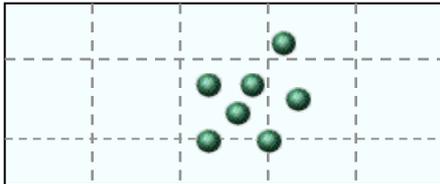

## Typical ultrashort pulse lasers parameters

Laser intensity	$10^{18} - 10^{22} \text{ W/cm}^2$
Laser pulse duration	30 fs – 1 ps
Laser wavelength	0.8 – 1 $\mu\text{m}$
Laser energy	1 J – 1 kJ

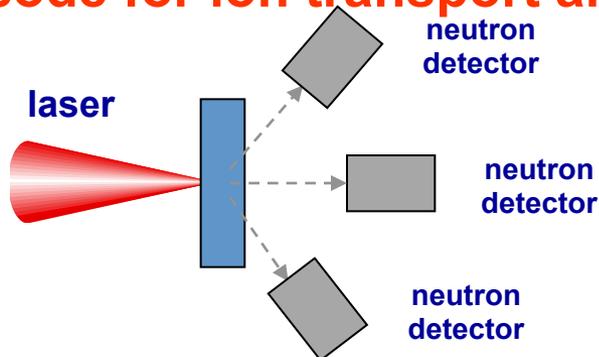

# Numerical capabilities developed at NRL

## 2D relativistic PIC code for laser-target interactions

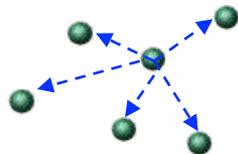

Ideal for modeling laser-target interactions and HEDP.

## 3D MC code for ion transport and neutron production

Neutron spectrum from nuclear fusion reactions can be calculated for an array of neutron detectors located around the target and compared to experimental data.

## 3D MD code for laser-cluster interactions

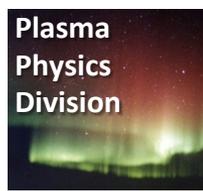

Perfect for modeling the nano-world: small clusters, thermodynamics and transport properties of matter, etc.

**Strong numerical capabilities with in-house developed codes for three widely used simulation techniques: particle-in-cell (PIC), molecular dynamics (MD) and Monte Carlo (MC).**

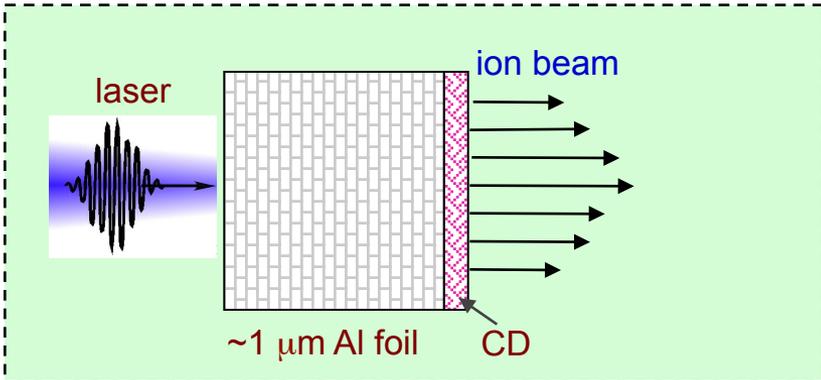

# Numerical approach for laser-target interaction & neutron production

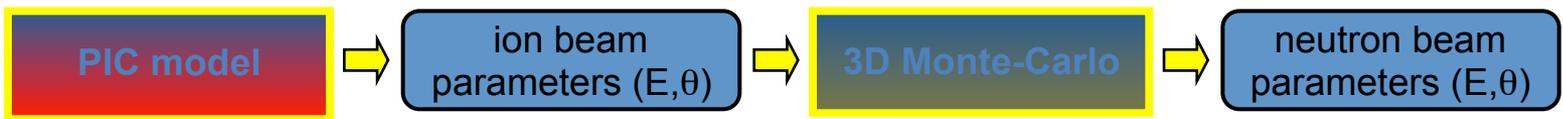

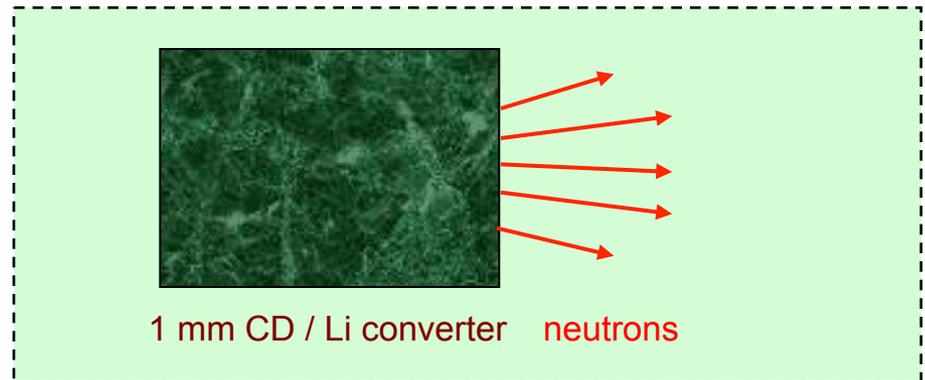

## Laser-target interaction model: 2D PIC

Model the interaction of intense ultra short laser pulses with thin foils using a 2D electromagnetic **particle-in-cell (PIC) model**.

## Ion beam-target interaction model: 3D MC

Utilize data output from the PIC model as input for a **3D Monte-Carlo model** simulating the production and scattering of neutrons

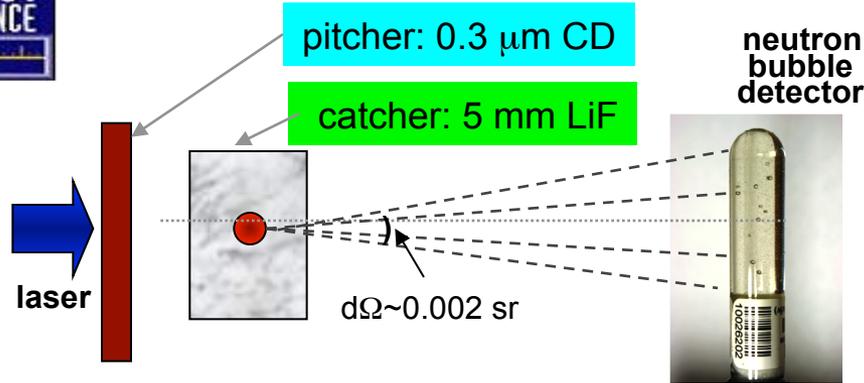

# Collaborative research with U. Michigan on laser-target interaction

- Perform field experiments at 3.2 km range using incoherently combined high-power lasers ( 6.2 kW,  $M^2 \sim 1$ )

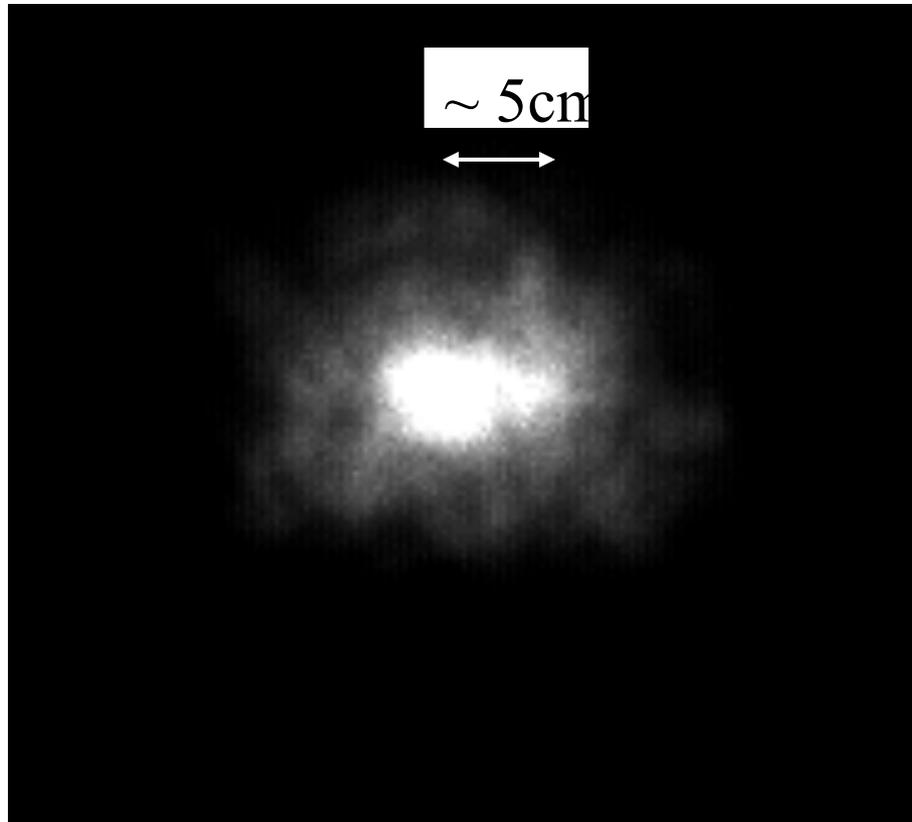

# NRL Fiber Laser Field Experiments at SOR Propagation Range 3.2 km

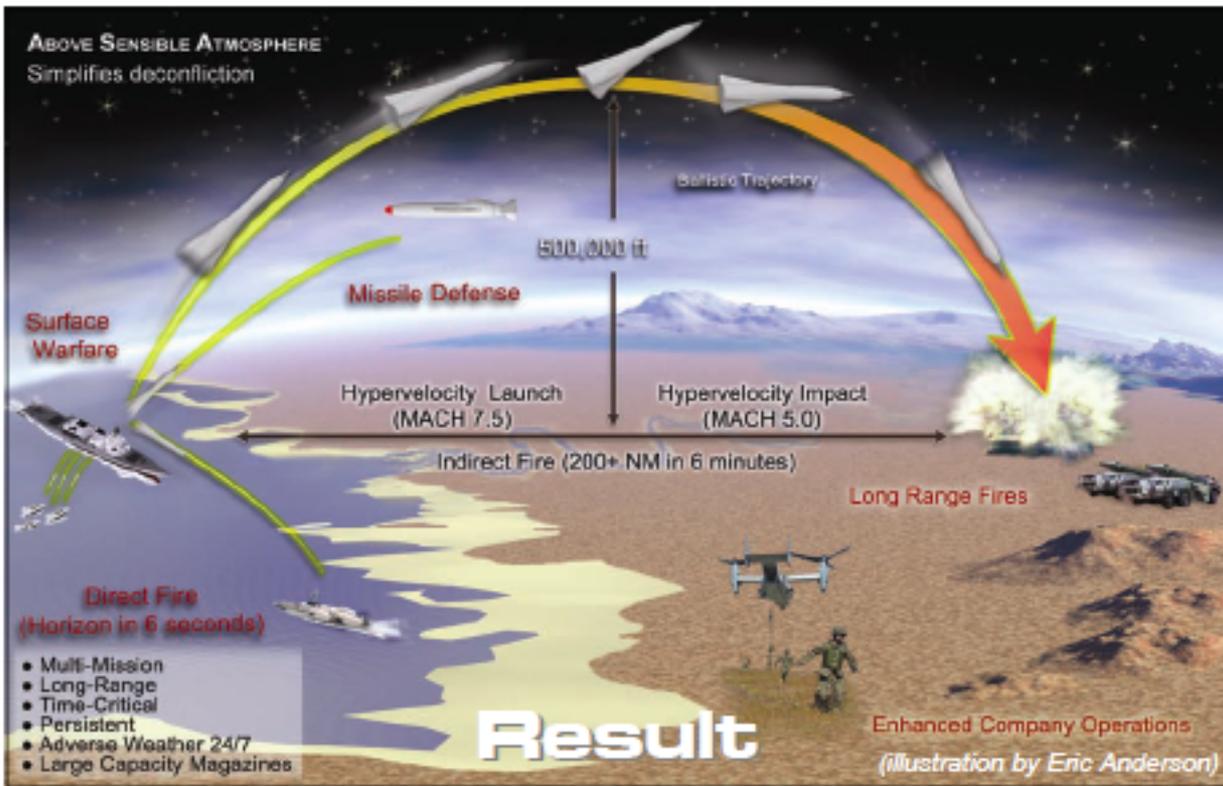

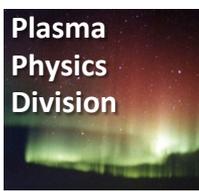

(Spot Size on Target at Low Power)

# ONR Railgun Innovative Naval Prototype

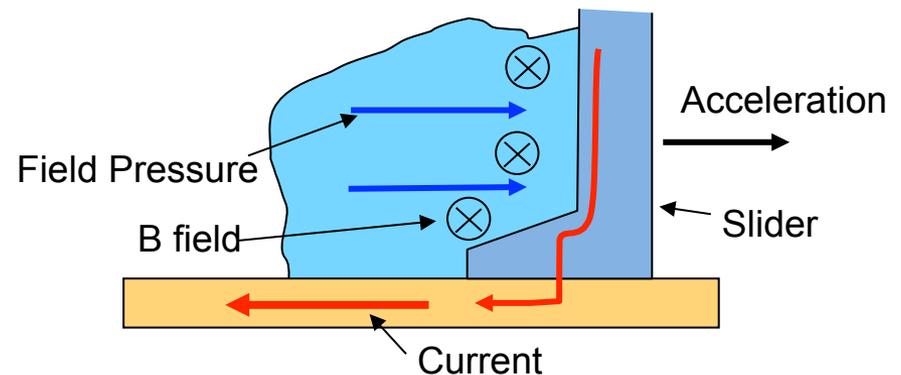

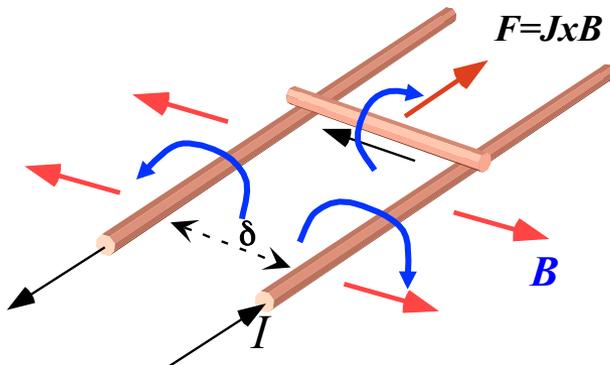

# How Railguns Work

- A railgun is basically a linear electric motor
- Current through a sliding short or armature reacts with its own magnetic field generating a  $J \times B$  force
- Acceleration relies on maintenance of the sliding contact
- High velocity and kinetic energy requires high current passing through the slider
- **Force ( $F=ma$ ) depends on current density ( $J$ ), magnetic field ( $B$ ), and area ( $A$ ) or total current ( $I$ )**

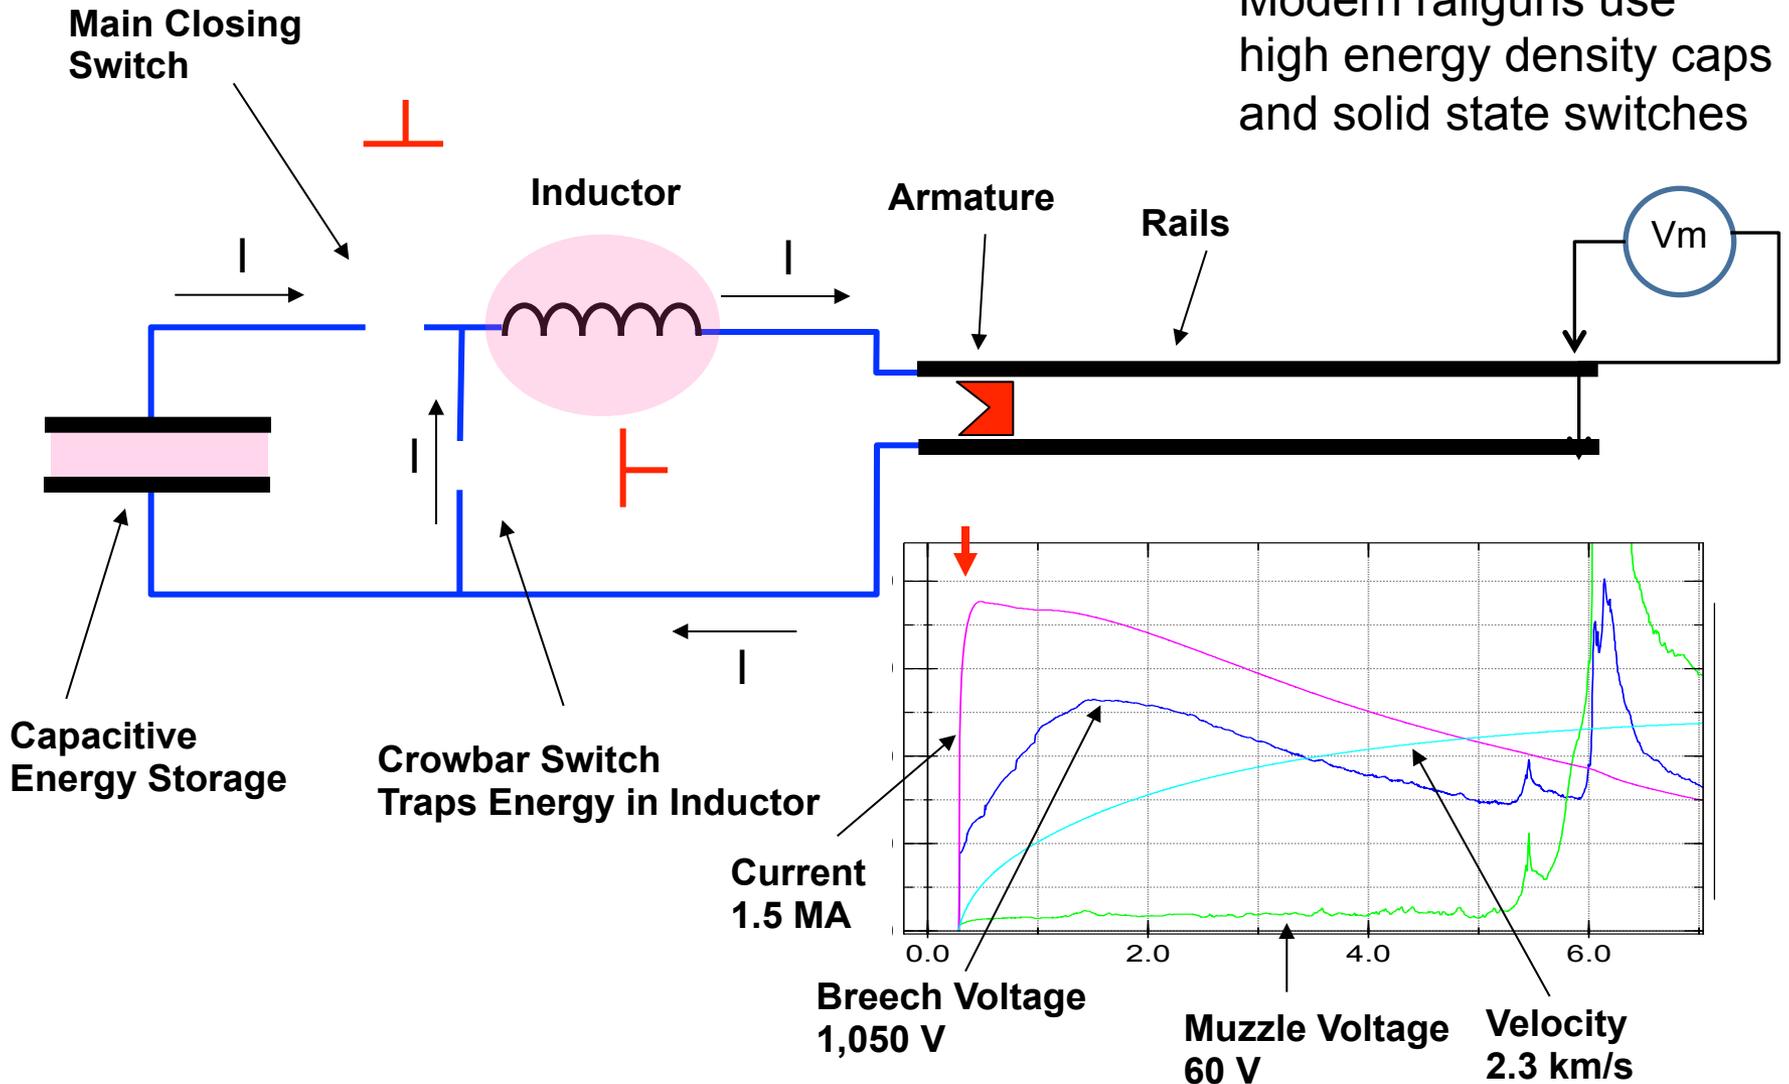

$$F = ma = \int J \times B dA \cong \frac{1}{2} IBA$$

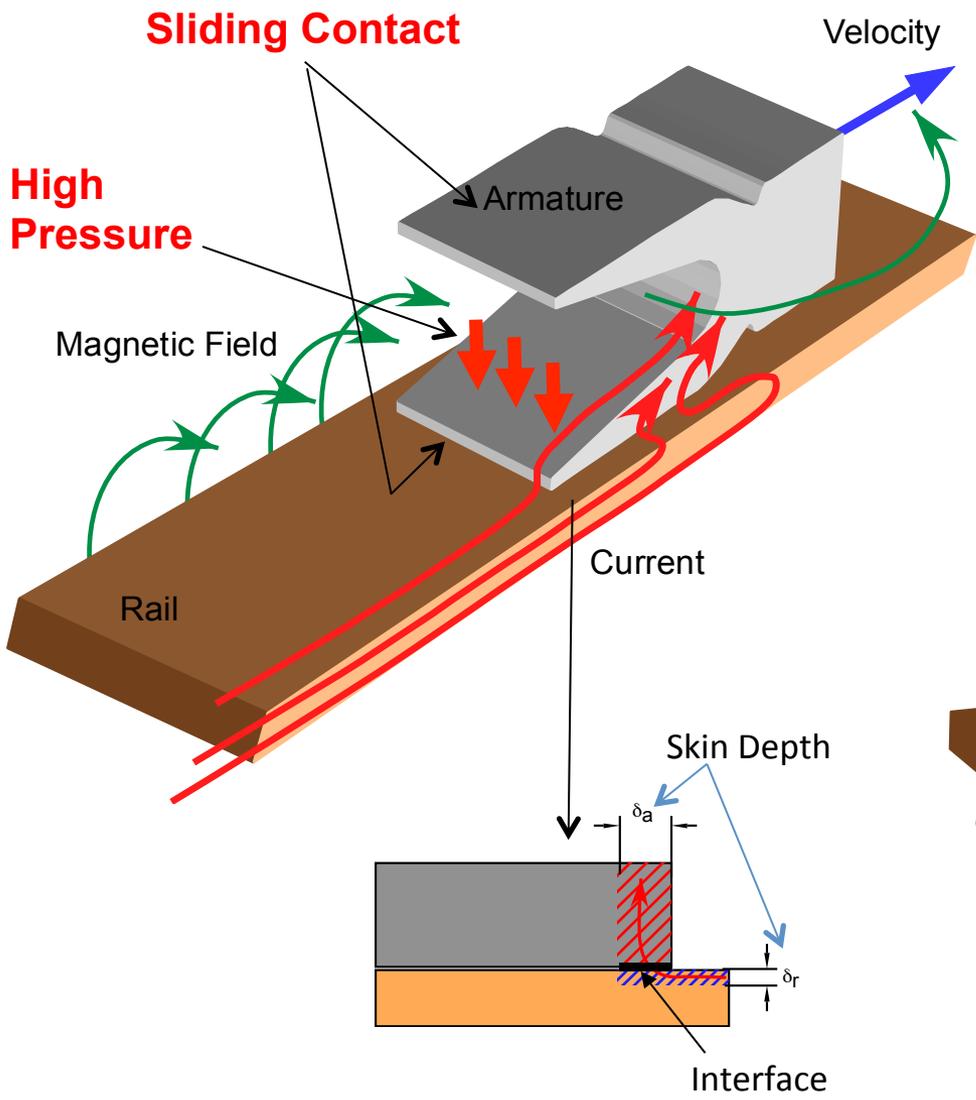

# MTF Railgun Operation

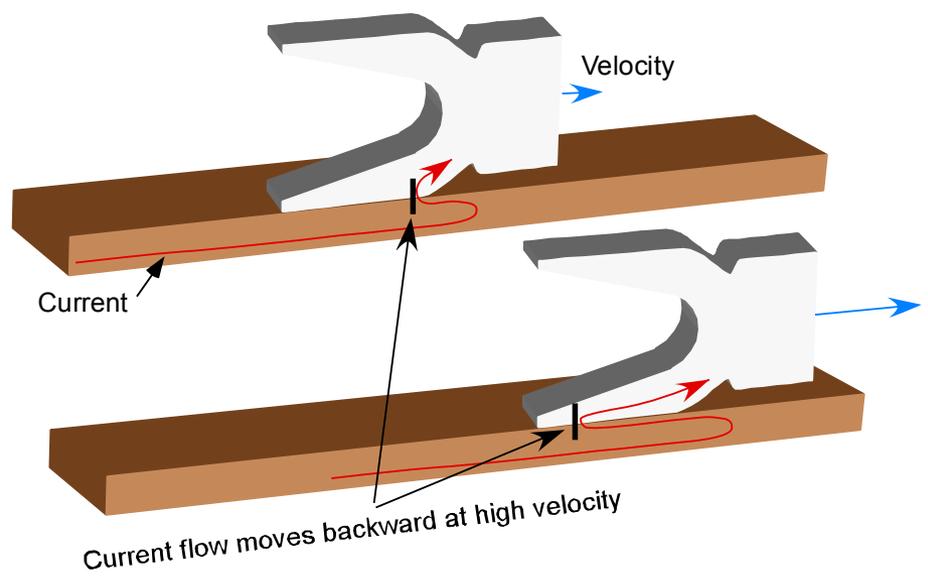

Modern railguns use high energy density caps and solid state switches

# Sliding Contacts

- High current sliding contacts dominate railgun physics
- High pressure metal-metal contact
- Time and velocity dependent current distributions
- Velocity comparable to field (current) penetration times

# Primary Damage Mechanisms

## Rails

- Edge Grooving – high current erosion of sliding contact
- Gouging – shock generation at high velocity contact
- Mechanical rail wear – high velocity heating of sliding interface
- Post Transition erosion – arc damage to metal electrodes
- Cyclic fatigue – repetitive extreme stress of materials
- Mechanical deformation – extreme stress

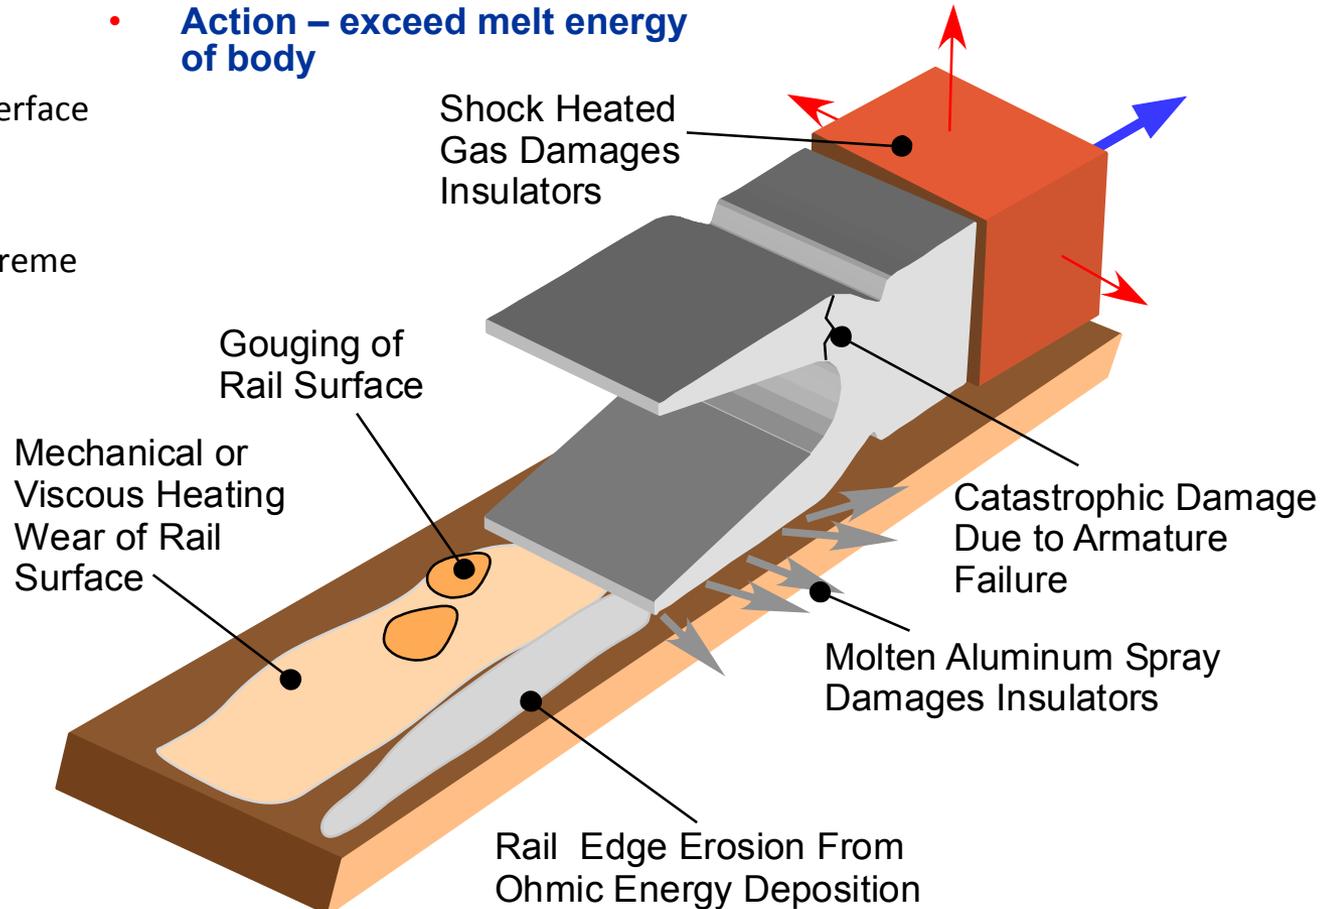

## Armatures

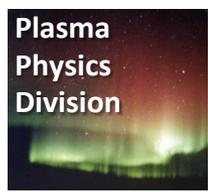

- Erosion – material melted from slider
- Fracture – cracking of legs, liquation cracking
- Action – exceed melt energy of body

## Insulators

- Thermal flux - high temperature gas
- Molten metal - hot debris

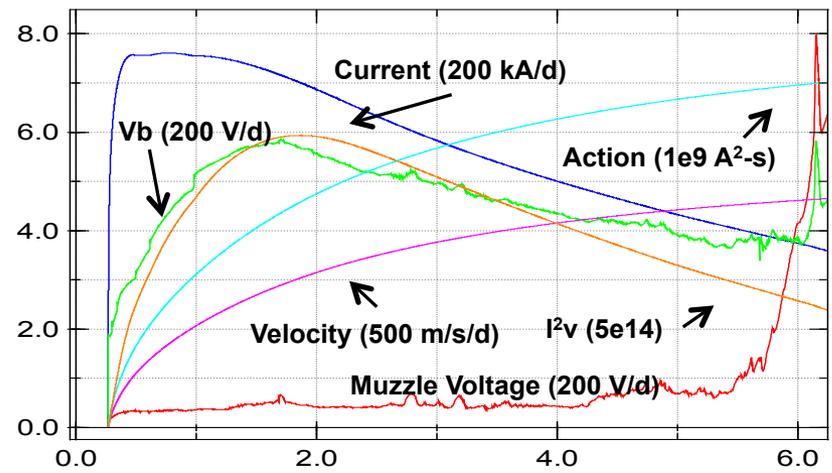

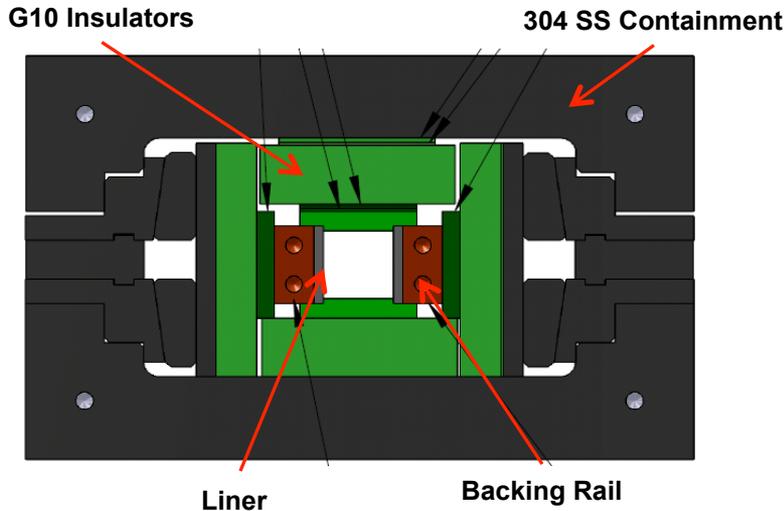

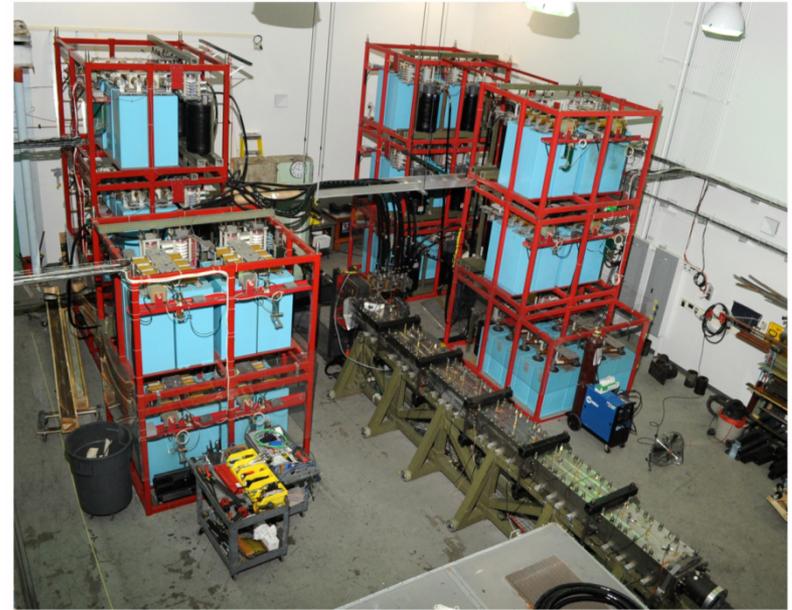

**10 GW Input Power**

# NRL MTF Facility

- 6-m long railgun, 5 cm bore diam.

ELECTRICAL EXPERIMENTER

June, 1918

## A 100 Mile Electro-Magnetic Gun

The illustration herewith shows a mighty 90-foot electro-magnetic gun, capable of hurling a torrent of 19-inch shells, each containing a charge of high explosives. It would be noiseless and smokeless, besides being mobile enough to permit its transportation from place to place at short notice. There would be no wear and tear on this gun as is the case now with the cannon using explosive charges to expel the projectile from the barrel. First described in this journal for November, 1915.

## At a Glance

### What is it?

■ The Free Electron Laser (FEL) provides naval platforms with a highly effective and affordable defense capability against surface and air threats, future antiship cruise missiles and swarms of small boats. Utilization of FEL also allows an unlimited magazine with speed-of-light delivery.

### How does it work?

■ FEL generates high-intensity laser light by utilizing the energy from unbound accelerated high-energy electrons. This technology is commonly used in the Department of Energy's particle colliders for basic subatomic research. The FEL program is an investment by the Office of Naval Research to transition the accelerator technology from particle colliders to a future ship self-defense weapon system.

### What will it accomplish?

■ FEL will equip U.S. ships that have high depth-of-fire with speed-of-light delivery, seconds dwell time and a deep magazine for a more powerful means of self-defense. It is a revolutionary weapon that will transform how the Navy fights future battles.

### Point of Contact

Quentin Saulter  
(703) 696-2594  
quentin.saulter@navy.mil

The Free Electron Laser (FEL) weapon system will provide U.S. ships with speed-of-light fire capability for a range of missions and threats, a key element of a future future shipboard layered defense.

An Innovative Naval Prototype program for the FEL technology began in 2010. It will demonstrate scalability of the necessary FEL physics and engineering for an eventual megawatt-class device. The program will focus on the design, development, fabrication, integration and test of a 100-kilowatt class FEL device. Future needs for ship integration and beam control are being considered.

This revolutionary technology provides multiple payoffs to the warfighter. The ability to control the frequency of the laser beam allows for operation in the maritime environment. The variability of the beam strength provides graduated lethality with minimum collateral damage and a low cost per engagement when compared to the projectile and logistics support costs of conventional explosive munitions. Against low value targets it is an effective alternative to the use of expensive missile systems. The FEL provides speed of light and precision engagement of both high speed, sophisticated anti-ship missiles, as well as swarming, slow speed, unsophisticated small craft.

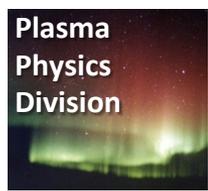

### Research Challenges and Opportunities:

- FEL weapons
- Injectors
- Accelerators
- Amplifier/oscillator designs
- Beam control
- Modeling and simulation
- Scalability

- Similar results from HPGe detector observing >1700 kV photons for 20 s

# Long-Range Power Beaming using High-Power CW Fiber Lasers

P.I. Dr. Rich Fischer

## Objective:

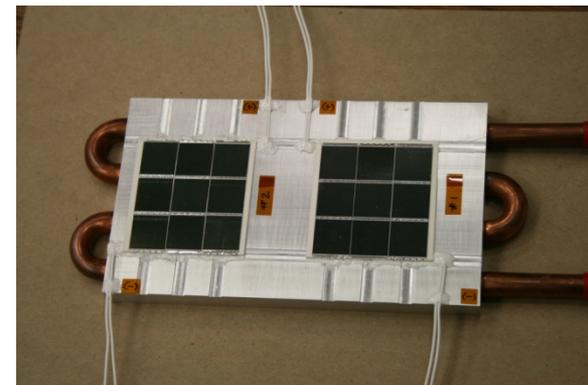

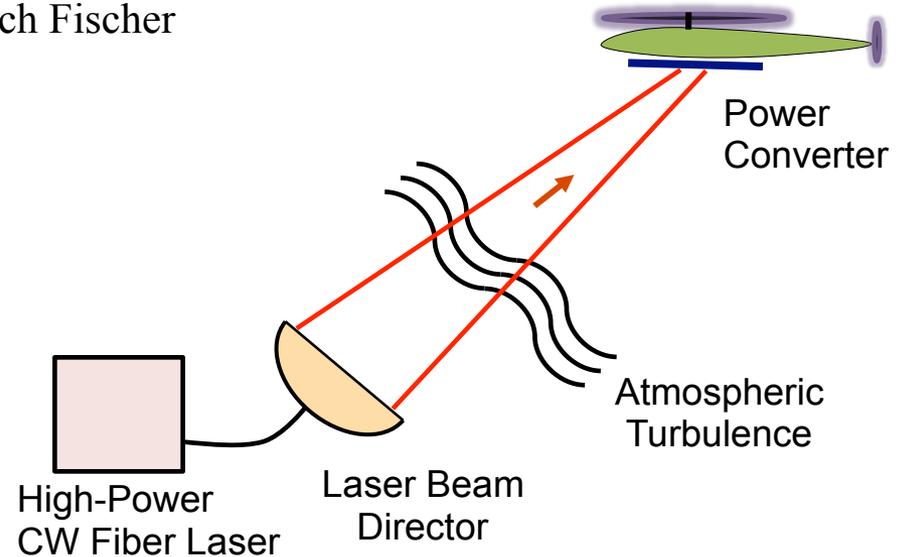

Evaluate long-range power beaming capabilities using high-power cw fiber lasers and advanced laser power converters.

## Payoff:

Laser power beaming can be used to increase the flight duration and operational capabilities of UAVs.

## Approach:

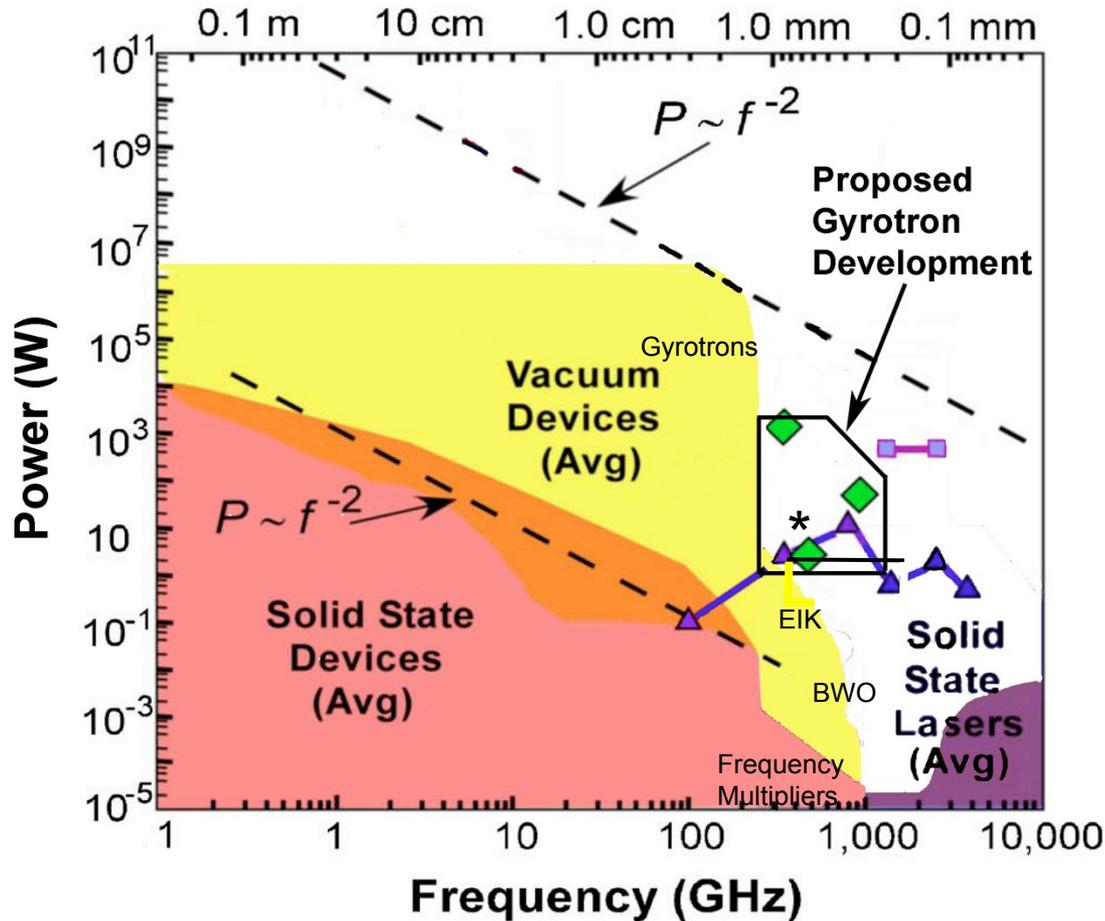

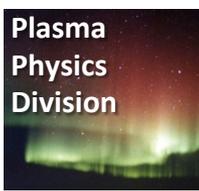

Conduct laboratory experiments to characterize laser power converters and beam directors using high-power cw fiber lasers. Perform long-range (3 km) power beaming field tests with stationary collectors. Conduct power beaming experiments with dynamic platforms, such as a UAV, and design a system for transition to TEW division.

Laser Power Converter Prototype

# Maximum Power of Vacuum Electronic, Solid State, and Quantum Electronic Devices

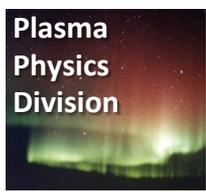

- Need for “compact and mobile” sources has spurred interest in scaling slow-wave vacuum devices to THz regime, i.e., DARPA HiFIVE Program Goal:  $P \sim 100$  W @ 220 GHz with 500 W-GHz BW (\*)
- Gyrotrons offer higher power for some DoD applications
- Fast-wave interaction scales well to short wavelengths

# Plasma Facilities - 6750

## Large Area Plasma Processing System S. Walton

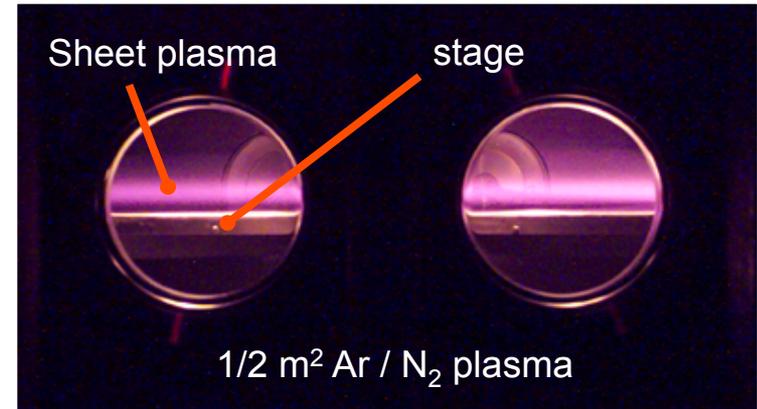

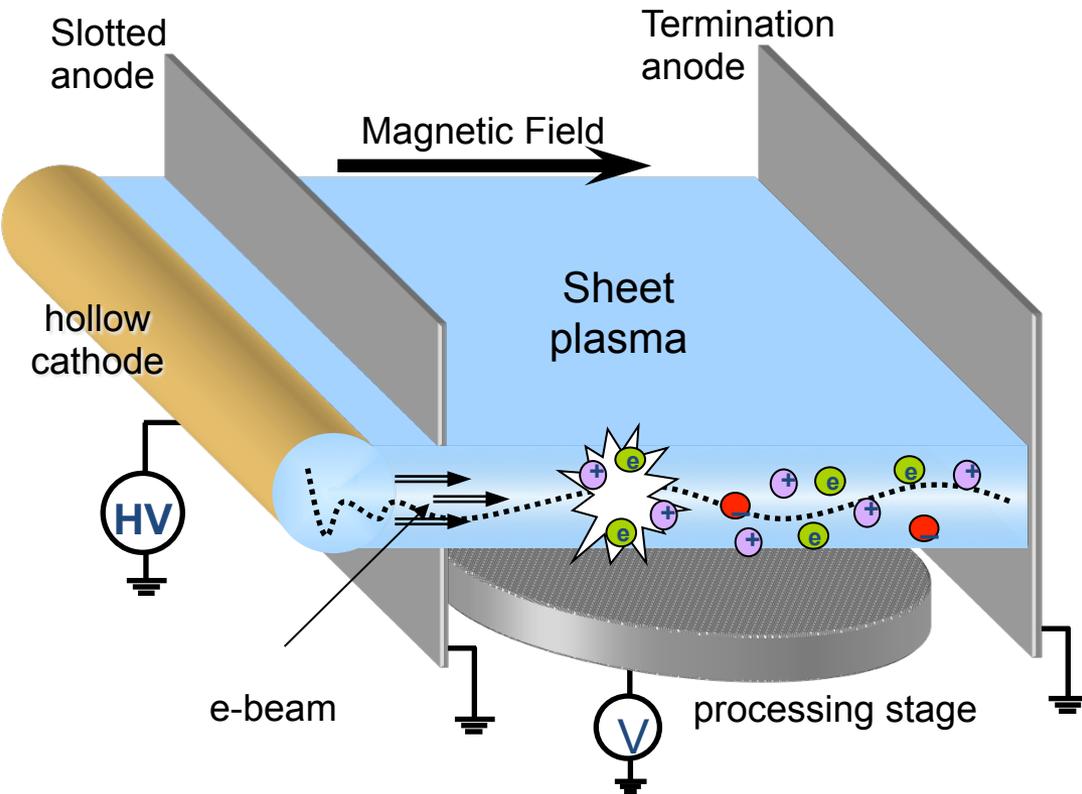

- Uses moderate energy (few kV) sheet electron beam for ionization
- Unique low temperature (0.5 eV) plasma suitable for treating delicate materials (polymers, organic semiconductors)

- Large volume permits scaled laboratory simulations of space plasma processes
- Plasma wave generation and instabilities, plasma flows, pitch angle scattering, etc.
- Supports efforts on radiation belt remediation concept
- Space hardware RDT&E

# LAPPS: Large Area Plasma Processing System\*

*A plasma source based on electron beam ionization*

## Typical Operation:

CW & Pulsed e - beam ~ 2 keV beam  
 Period = 2 - 60 ms, Duty = 10% - 100%  
 B = 150 - 200 Gauss (for beam collimation)  
 P = 5 - 150 mTorr

## Typical Plasma Source dimensions:

thickness ~ 1cm  
 Width (hollow cathode length) ~ 25 - 50 cm  
 Length (beam distance) ~ 50 -100 cm

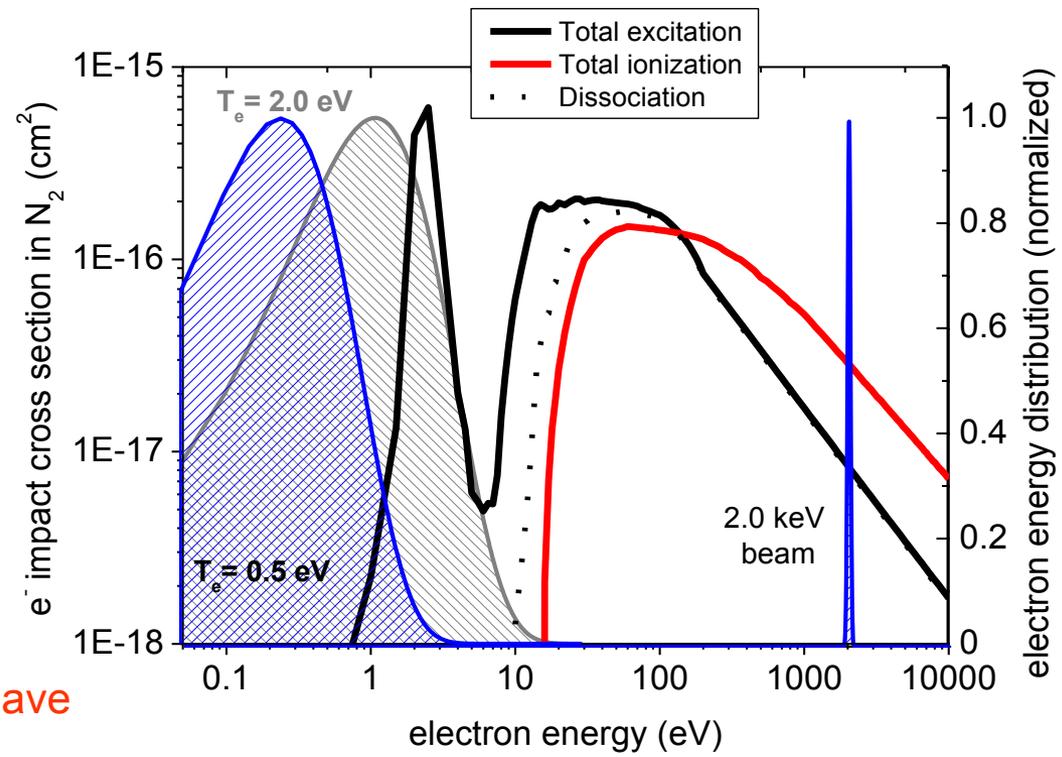

\* US patent no. 5,874,807 (Feb. 1999)

# Plasma generation with high-energy electron beams

- In discharges,
  - small fraction of electrons ionize gas
  - most energy is used to excite the gas
- The injection of a 2 keV beam into the background gas will directly ionize and dissociate the gas.
  - more *efficiently* ionize
  - no threshold determination
  - ionize all species equally
  - density controlled by beam current
- The plasma (or secondary) electrons have much a lower energy
  - are not required to sustain the plasma
  - cooled electrostatically and through inelastic collisions

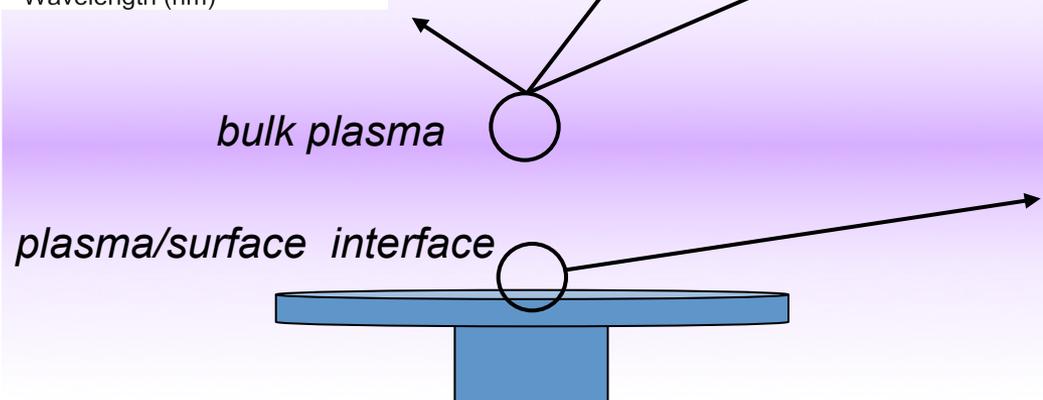

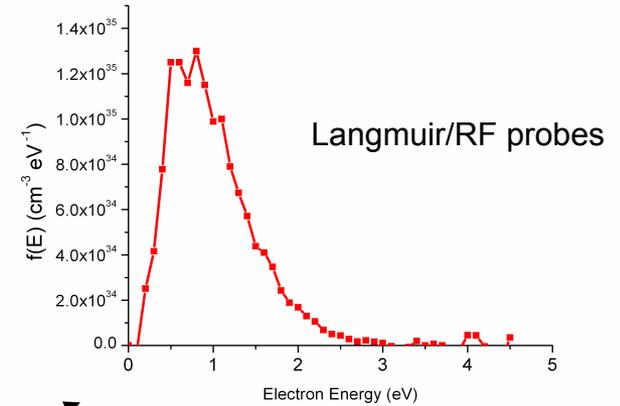

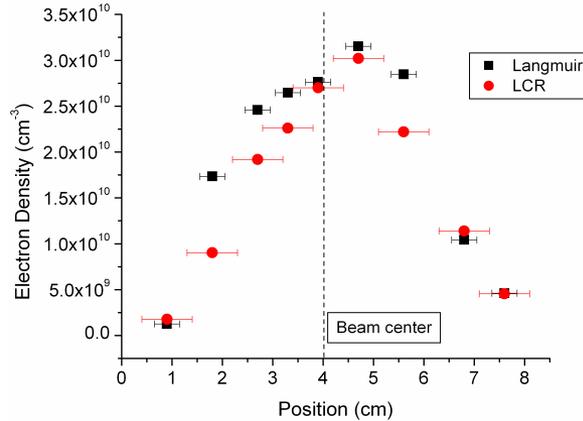

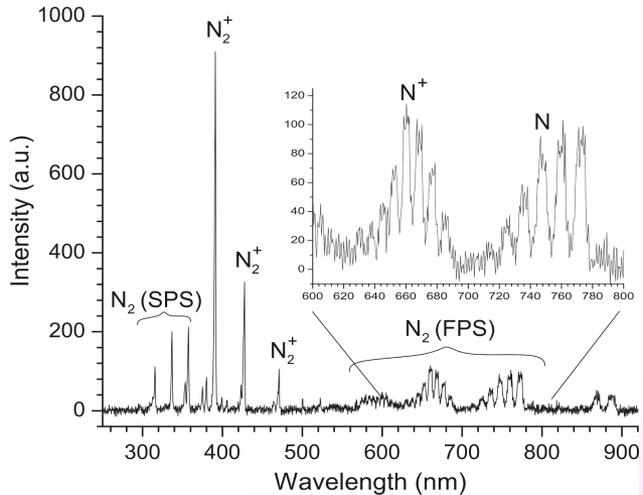

The resulting high  $n_e$  and low  $T_e$  are key attributes

**Access to new operating parameters opens up new opportunities in plasma processing**

# Processing of “energy sensitive” materials

Materials where roughening or etching is not good ...

## Polymers - *surface roughening is an issue*

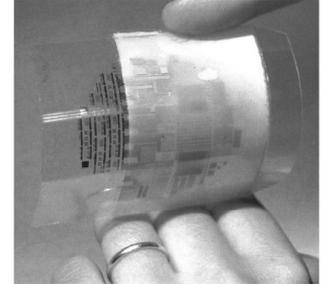

- In the development of organic transistor devices (Materials Today 10(3) 2007).
- In new 193 nm photoresists.
- In the development of thin, multi-stack capacitors.
- In biosensor development, presentation can be adversely impacted

## Graphene (or other 2-D materials) - *etching is not an option*

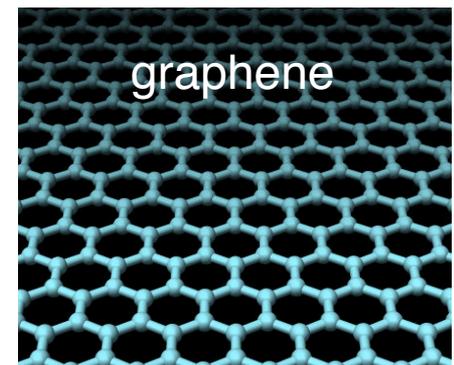

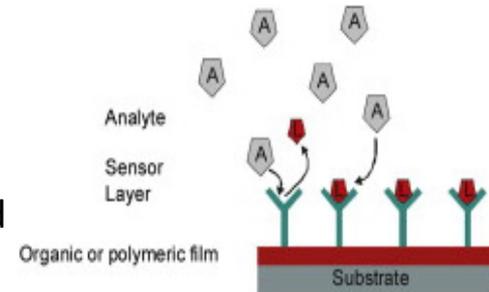

- Single monolayer of  $sp^2$  bonded carbon with some of the best thermal and electrical properties known
- Carbon-based nanoelectronics is the best candidate to replace CMOS technology in the future. ITRS (July 2008)
- However, to realize its full potential, its chemistry needs to be managed ...

In the processing of either material, we aim to impart functional groups to the surface to improve their performance in a variety of applications

Flexible electronics

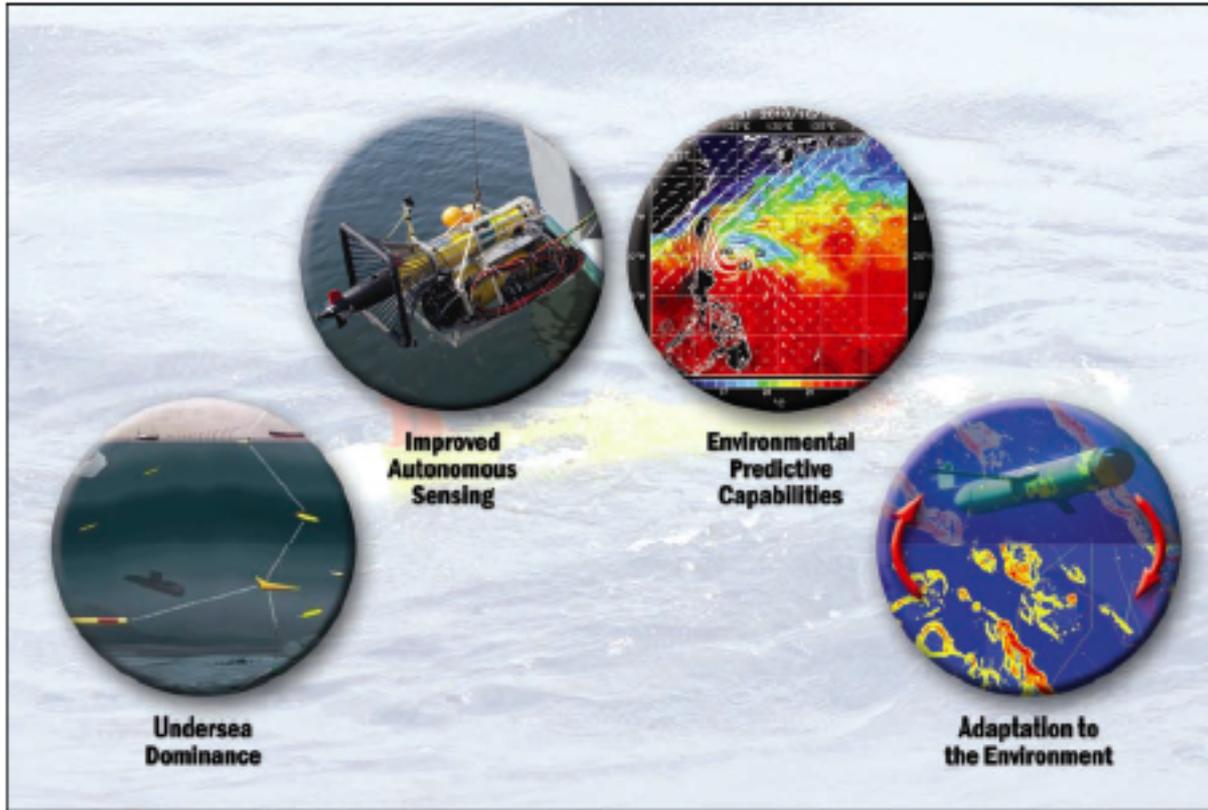

Biosensors

# Assure Access to the Maritime Battlespace

**Vision:** Assure access to the global ocean and littoral reaches and hold strategic and tactical targets at risk. Sense and predict environmental properties in the global ocean and littorals to support tactical and strategic planning and operations. Improve operational performance by adapting systems to the current and evolving environment.

# 6795 Intense Underwater Laser Lab

## Unique Laser Facility & Diagnostic Suite

### Laser pulse, plasma & shock characterization

- High-resolution, intensified, gated ( $\tau_{\text{res}} \geq 0.8$  ns) CCD cameras
- Fiber-coupled & imaging spectrometers
- Sub-ns-resolution streak cameras
- High-pressure (kbar) gauges
- Dark-field shadowgraphy (schlieren) imaging of shock propagation

### Test Chambers: Underwater Laser Plasma Chamber

- Volume  $\approx 1$  m<sup>3</sup>
- Multiple optical quality access ports for laser beams & imaging

### Laser Filament Imaging Chamber

- Variable length water tube with high-resolution beam profile imaging

### Portable nanosecond 532 nm Lasers:

- 1) 2 J, 6 ns; 2) 450 mJ, 9 ns; 3) 60 mJ, 4 ns

### Portable picosecond 532 nm Lasers:

- 125 mJ, 100 ps

### Laboratory femtosecond 400 nm Lasers:

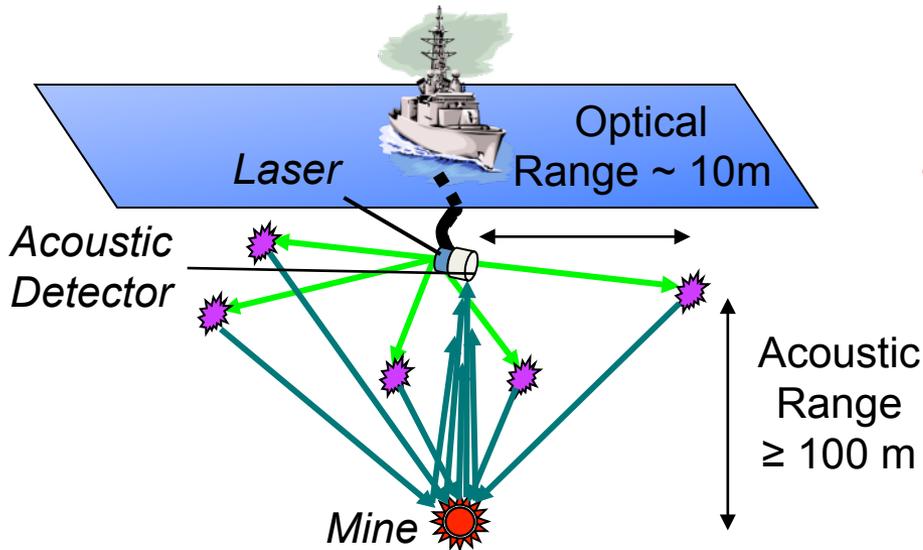

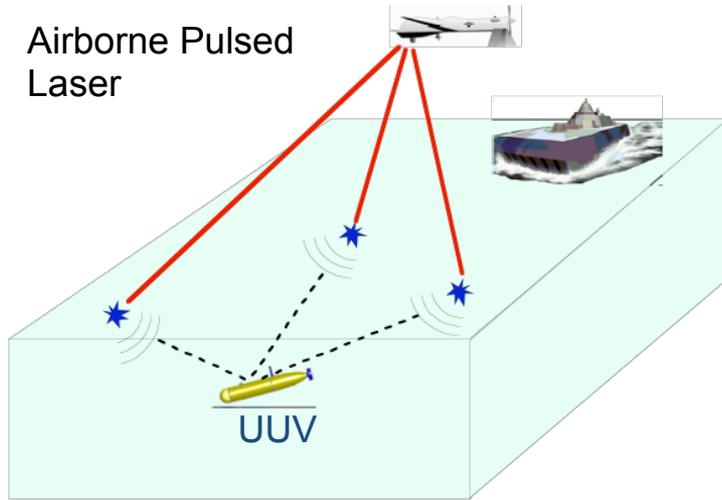

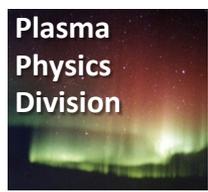

- 1)  $\sim 0.5$  J, 50 fs @ 10 Hz; 2) 7 mJ, 35 fs @ 1 kHz

# NRL Remote Underwater Laser Acoustic Source (RULAS)

P.I. Dr. Ted Jones

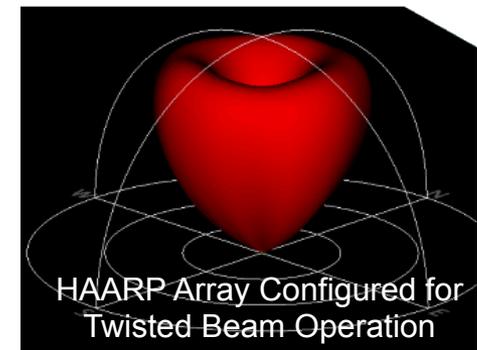

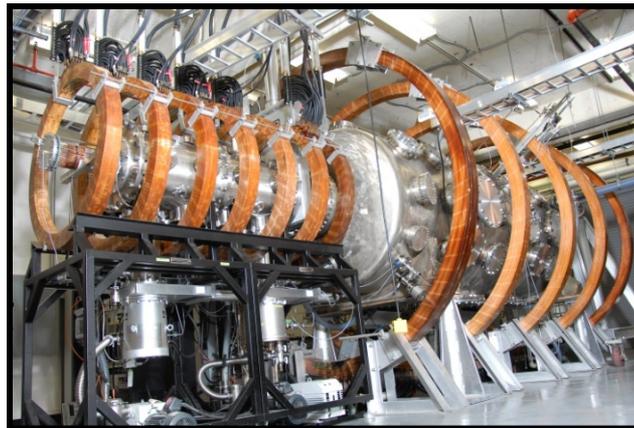

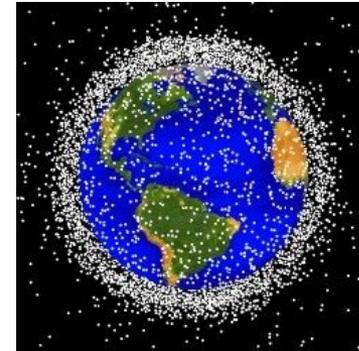

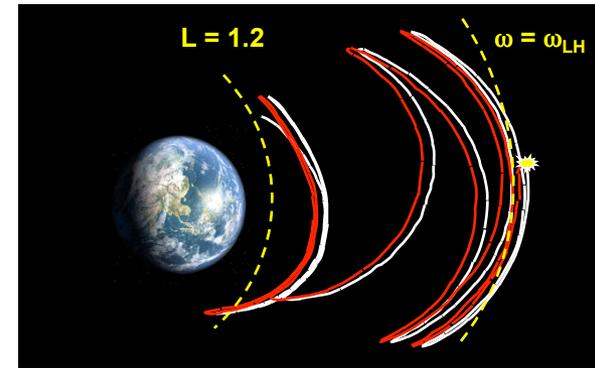

- **Acoustic communications**
  - Transmit from airborne laser platform to submarine or UUV
  - Dynamically change instructions as mission & data change
  - Optically penetrate thermocline
- **Virtual acoustic beacon array for UUV navigation** (analogous to GPS)
  - Airborne laser generation of acoustic pulse trains with encoded location and time
- **SONAR applications**
  - Detect and identify mines & other underwater targets
  - Map sea floor topography
  - Laser acoustic imaging

# Space Experiments and Projects

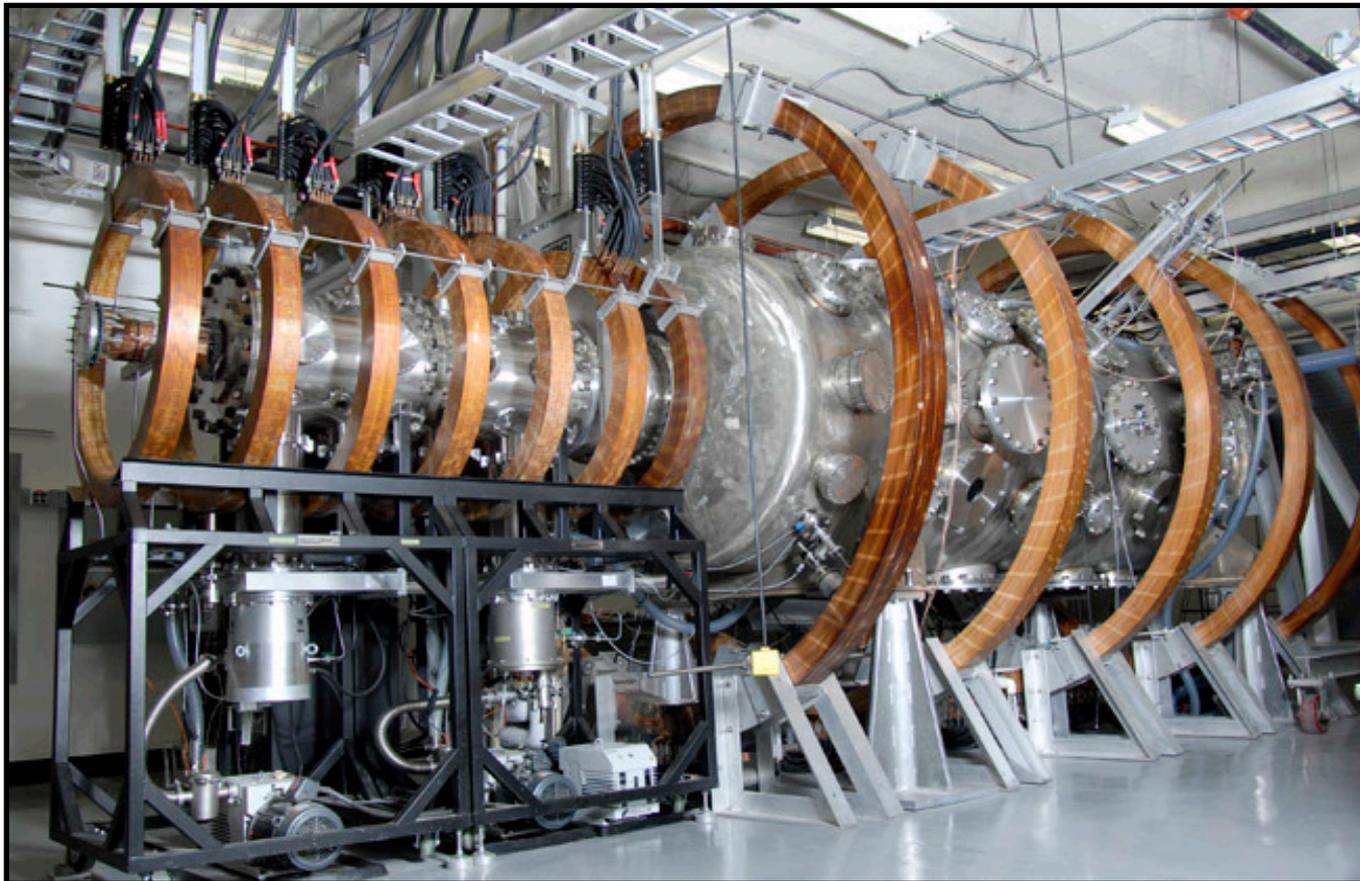

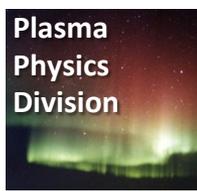

- CARE – CARE II
- PERCS
- Radiation Belt Remediation
- Orbital debris
- Shuttle burns
- HAARP
- Space Chamber Expts

# NRL Space Physics Simulation Chamber: unique for basic plasma experiments & simulation of space plasma phenomena

Large volume, steady-state, space-like plasmas

2-m diameter by 5-m main vacuum chamber

2 m of plasma column source chamber section

Steady-state magnetic fields ranging from 0 to 1000 G levels.

Variable plasma conditions simulate many regions of near-Earth space

Experiments include:

- radiation belt dynamics,
- broadband ionospheric ion-cyclotron wave generation,
- wave and Joule heating of ionospheric plasma,
- magnetotail particle and wave dynamics.

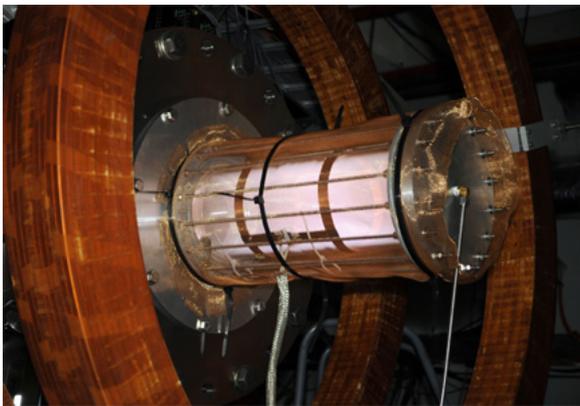

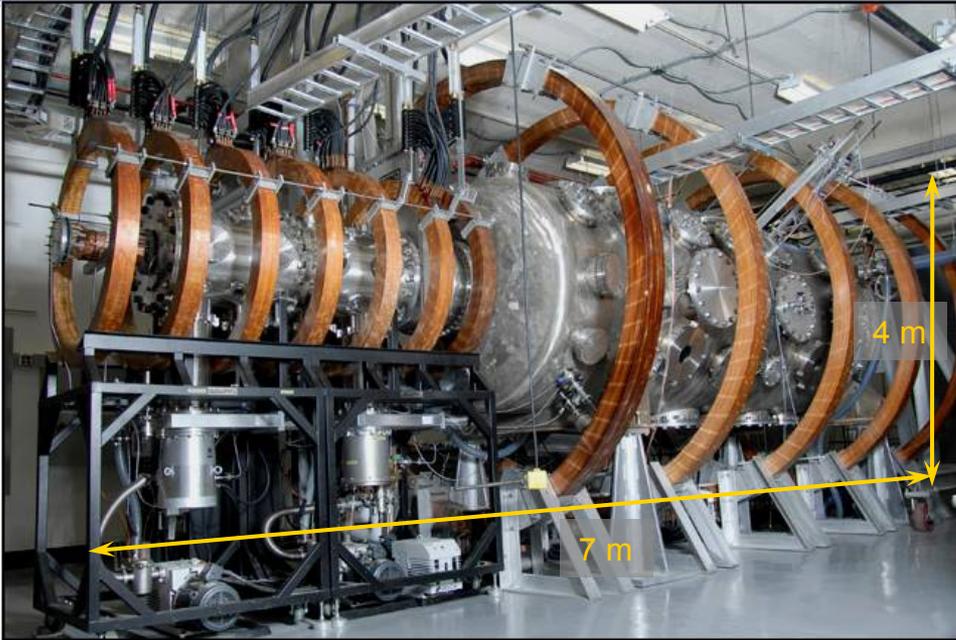

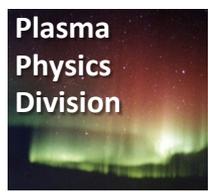

Spacecraft diagnostic development and hardware testing/qualification

Bill Amatucci – NRL POC

# NRL Space Physics Simulation Chamber

## Experimental Parameters

Plasma Species	Argon (A=40)
Plasma Density ( $n_e$ )	$10^9 - 10^{11} \text{ cm}^{-3}$
Electron Temperature ( $T_e$ )	3 - 5 eV
Ion Temperature ( $T_i$ )	$\sim 0.07 \text{ eV}$
Ion Cyclotron Frequency ( $f_{ci}$ )	11.5 kHz

## Dimensionless Parameters

Parameter	Ionosphere	SPSC
$\omega_{pe}/\Omega_e$	0.1-10	0.01-50
$\rho_i/L_E$	0.01-0.7	0.6
E/B	< 30 km/s	< 20 km/s
$\beta = nkT/(B^2/2\mu_0)$	$10^{-7}$ - $10^{-4}$	$10^{-7}$ - $10^{-4}$

# NRL Space Physics Simulation Chamber (Bill Amatucci)

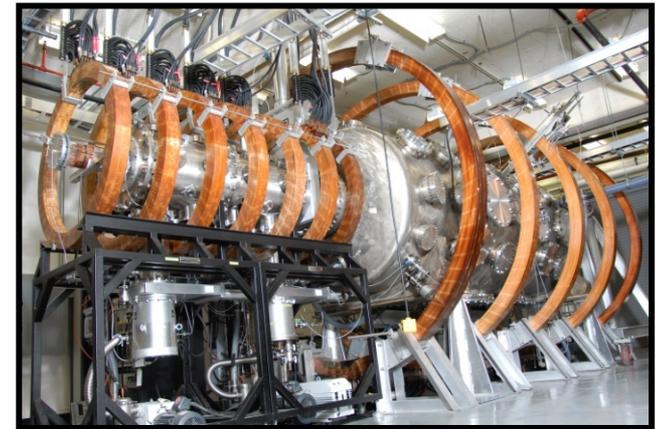

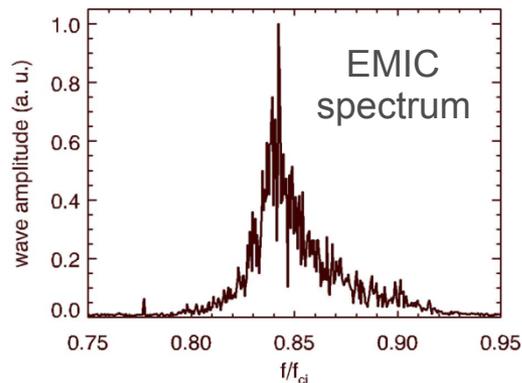

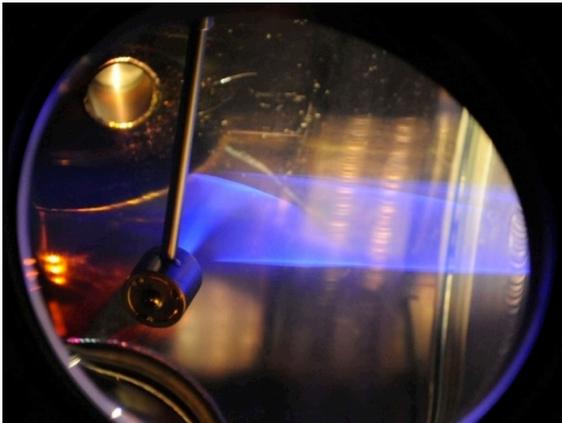

Plasma  
Physics  
Division

## Research Questions

- **How do artificial radiation belts form in the post-HAND environment?**
  - What wave characteristics are important for pitch-angle scattering?
  - How do the various plasma wave modes interact and transition?

## Experimental Tasks

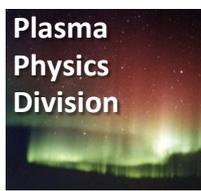

- **Characterize the Shear-Driven EMIC Wave-Vector Spectrum**
- **Develop antennas for launching EMIC waves**
- **Investigate EMIC wave energetic electron pitch-angle scattering**
- **Investigate transitions between EM wave modes (Option Years)**

# SAMI3: NRL Ionosphere Model (Joe Huba)

Comprehensive: multi-ion dynamic

Neutral species input:

1) theoretical model: TIEGCM, or

2) empirical: such as

NRLMSISE00/HWM93/HWM07

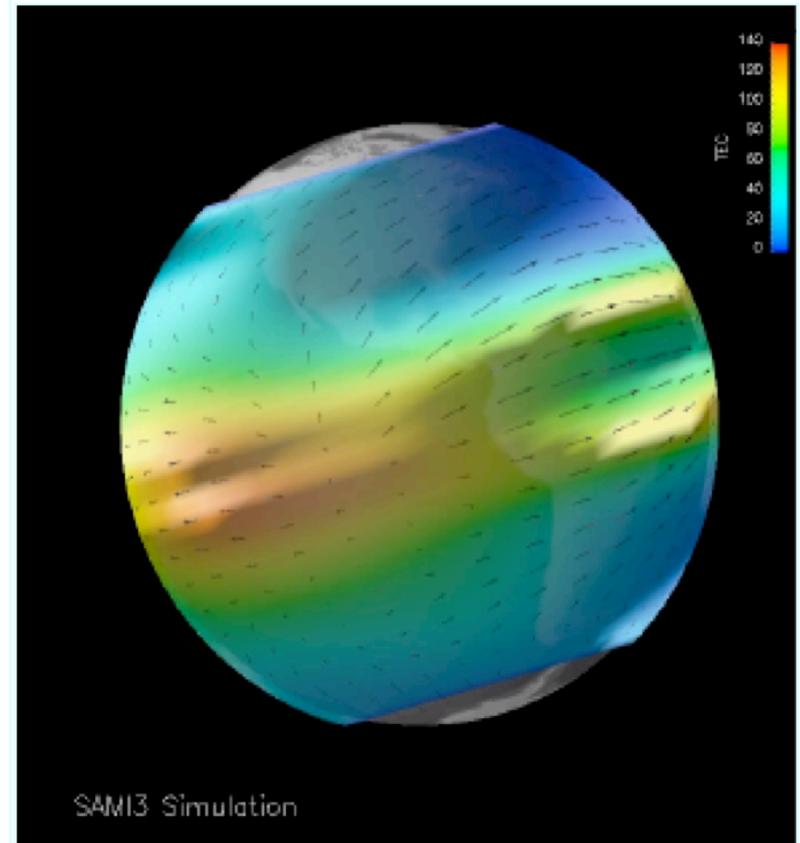

EUV model: EUVAC empirical model

Magnetic latitude range ( $\pm 60^\circ$ )

Nonorthogonal, nonuniform fixed grid

Self-consistent potential solver

Tilted Dipole Field

*The NRL Ionosphere Model & the Heart of ISES-OE (Plasma Physics Division).*

# Space Weather Modeling

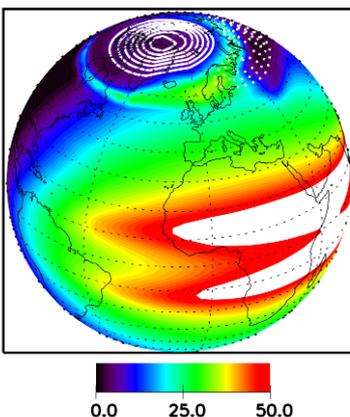

Plasma  
Physics  
Division

## Plasma simulation models

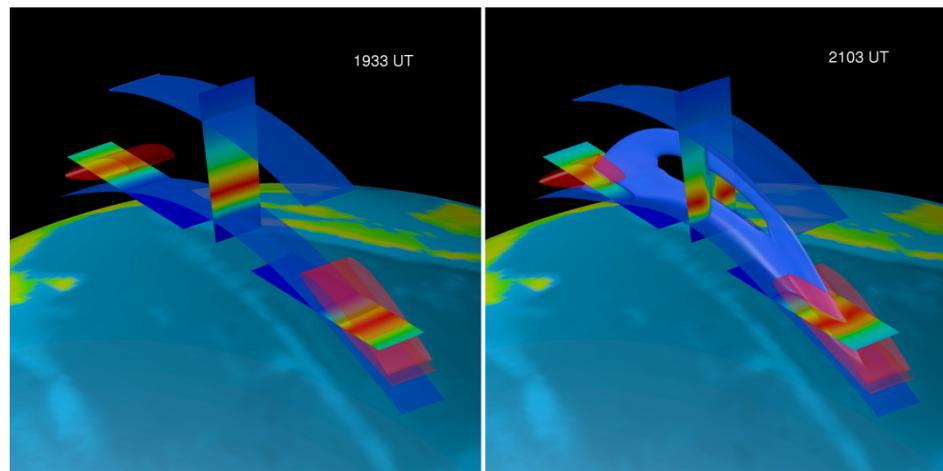

- SAMI-2 and SAMI-3 (Ionosphere)
- LFM (Magnetosphere)
- RCM: Ring current

## Predicted Total Electron Content Map

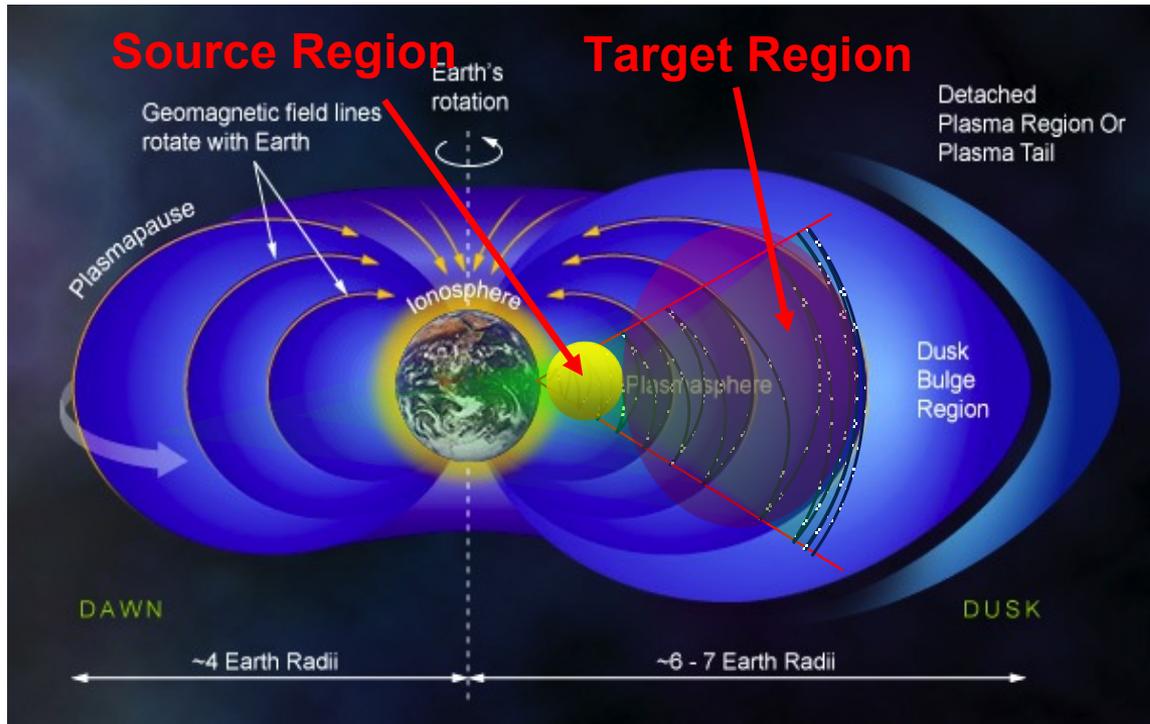

## Ionospheric Physics

J. Huba

- Electron density isosurfaces from SAMI-3 simulation code
- First fully 3-D simulation of equatorial spread F (ESF)
- Plasma bubble can affect communications

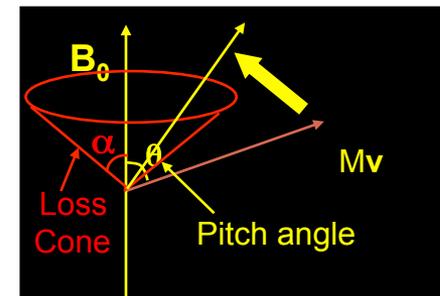

# NRL Rapid Remediation Concept

Geometry of Experiment

G Ganguli

- CONCEPT:
- Inject massive amount of energy over a short period
- APPROACH:
- Release neutral gas from a satellite moving perpendicular to the magnetic field and convert the orbital kinetic energy of the neutrals into free energy for sustaining EM waves that pitch-angle scatter electrons from belts

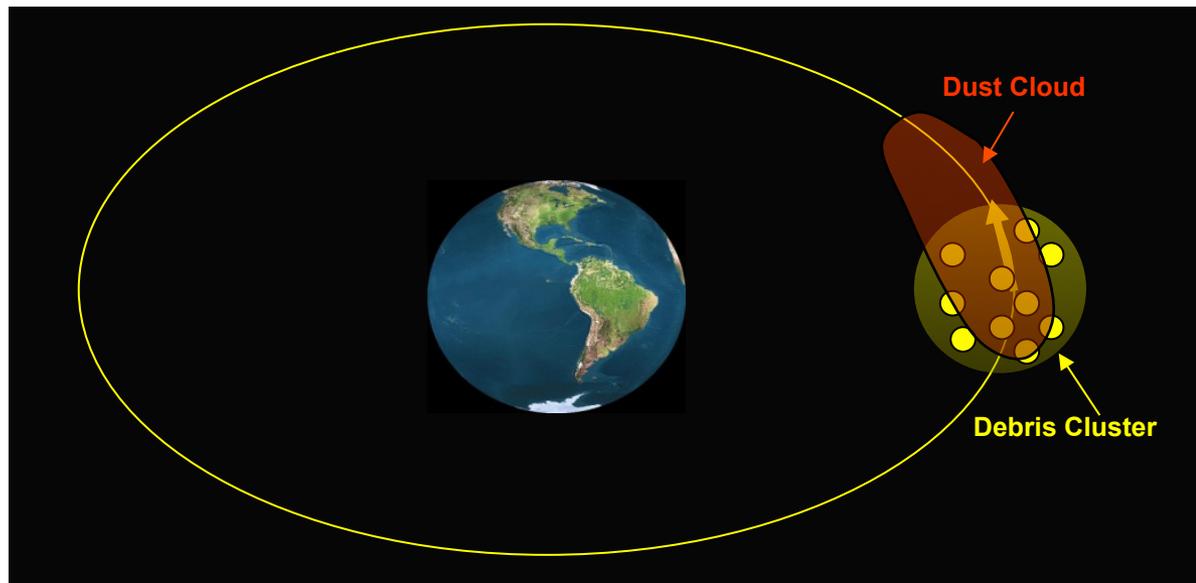

# Elimination Of Space Debris Through Induced Drag Enhancement

Plasma  
Physics  
Division

G. Ganguli

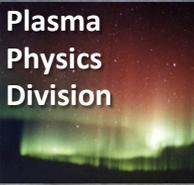

## Objective:

- (1) Develop the concept of artificially generating and maintaining a dust layer in the near-earth plasma environment to induce enhanced drag on space debris
- (2) Develop proof-of-principle experiments to validate the novel concept
- (3) Design a detailed blueprint for a space demonstration experiment

## Approach:

- (1) Determine requirements for inducing enhanced drag on space debris by artificially creating and maintaining a dust layer in space.
- (2) Choose orbits of space debris and calculate the minimum drag necessary for forcing their orbits to decay into the atmosphere.
- (3) Determine the volume, dust size, and duration necessary for a stable dust layer to produce the necessary drag enhancement

Thank you for your attention
